OF

THE LIFE, WRITINGS, AND DISCOVERIES

OF

SIR ISAAC NEWTON.

BY SIR DAVID BREWSTER, K.H.

A.M., LL.D., D.C.L., F.R.S., AND M.R.I.A.,

One of the Eight Associates of the Imperial Institute of France—Officer of the Legion of Honour—
Chevalier of the Prussian Order of Merit of Frederick the Great—Honorary or Corresponding
Member of the Academies of St. Petersburg, Vienna, Berlin, Turin, Copenhagen,
Stockholm, Munich, Göttingen, Brussels, Haerlem, Erlangen, Canton de
Vaud, Modena, Florence, Venice, Washington, New York, Boston,
Quebec, Cape Town, etc. etc.; and Principal and Vice-
Chancellor of the University of Edinburgh.

Second Edition.

VOL. II.

EDINBURGH:

EDMONSTON AND DOUGLAS.

MDCCLX.

Ergo vivida vis animi pervicit, et extra
Processit longe flammania moenia mundi :
Atque omne immensum peragravit mente animoque.

v.2

CONTENTS OF VOLUME II.

CHAPTER XV.

Nicolas Facio de Duillier attacks Leibnitz—Leibnitz appeals to Newton—He reviews Newton's "Quadrature of Curves," and accuses him of Plagiarism—Newton's opinion of the Review—Dr. Keill defends Newton as the true inventor of Fluxions, and apparently retorts the charge of Plagiarism on Leibnitz, who complains to the Royal Society—Keill explains his defence—The Royal Society approves of his explanation—Leibnitz calls Keill an upstart, and begs the Royal Society to silence him—The Society appoints a Committee to inquire into the claims of Leibnitz and Newton—The Committee report to the Society, who publish the result in the "Commercium Epistolicum"—Instigated by Leibnitz, John Bernoulli attacks the Report, and asserts, in a private Letter to Leibnitz, that he was the first inventor of the new Calculus—Leibnitz circulates this Letter in a Charta Volans, and gives up Bernoulli as the author of it—Keill replies to this Letter, and attacks Bernoulli as its author, who solemnly denies it to Newton—Leibnitz attacks Newton in a Letter to the Abbé Conti—Newton replies to it—The Controversy excites great interest—Leibnitz urges Bernoulli to make a public declaration in his favour—Bernoulli sends to Leibnitz the celebrated Letter "Pro Eminente Mathematico," on condition of his name being kept secret—Leibnitz and Wolf alter this Letter improperly, and publish it in such a form that Bernoulli is proved to be its author—Bernoulli is annoyed by the discovery, and endeavours, by improper means, to evade the truth—The Abbé Varignon reconciles Newton and Bernoulli—Death of Leibnitz—Newton writes a History of the Calculus—General view of the Controversy, and of the conduct of the parties,

PAGE

1-43

CHAPTER XVI.

Newton declines taking Orders—His Rooms in Trinity College—John Wickins his chamber-fellow—Letter from Mr. Nicolas Wickins, his Son—Dr. Humphrey Newton his Amanuensis from 1684-1689—His two Letters to Conduitt—Newton's Speculations on the Theory of the Earth—James II. attacks the rights of the Charter-*House*, and sends an illegal Mandamus to

the University of Cambridge—Newton one of the Delegates to resist this encroachment on its privileges—The Vice-Chancellor deposed—The object of the Deputation gained—Neglect of the Scotch Universities—Newton elected Member for Cambridge to the Convention Parliament—His habits of business—His letters to Dr. Covel—His acquaintance with Locke—His Theological inquiries—Locke exerts himself to procure for him some permanent appointment in King's College, the Charter-House, and the Mint—Failure of that attempt—Newton's disappointment—Ingratitude of his Country—Death of his Mother at Stamford—Writes an Account of Fluxions and Fluents for Wallis—His letter to Locke on multiplying Gold—Boyle's Recipes and Belief in Alchemy,

44-77

CHAPTER XVII.

Newton's health impaired—The Boyle Lectures by Bentley, who requests Newton's assistance—Newton's first Letter to Bentley on the Formation of the Sun and Planets—His second Letter—Rotation of the Planets the result of Divine power—His third Letter—Hypothesis of Matter evenly diffused—Letter of Bentley to Newton—Reply to it by Newton in a fourth Letter—Opinion of Plato examined—Supposed mental Illness of Newton ascribed to the burning of his MSS.—Referred to in the Letters of Huygens and Leibnitz—Made public by M. Biot—Mentioned in the Diary of Mr. De la Pryme—The story referred to disproved—Newton's Papers burnt before 1684—Newton's Letter to Mr. Pepys—Letter of Mr. Pepys to Mr. Millington—Mr. Millington's reply—Mr. Pepys' second Letter to Mr. Millington—Newton solves a Problem in Chances—His Letter to Locke—Reply of Locke—Newton's Answer, explaining the cause of his Illness—His Critical Letter to Dr. Mill—His Mind never in a state of derangement, but fitted for the highest intellectual efforts,

78-107

CHAPTER XVIII.

Newton occupied with the Lunar Theory—His Correspondence with Flamsteed, the Astronomer-Royal—Newton's Letters to Flamsteed, published by Mr. Baily—Controversy which they occasioned—Flamsteed's Letters to Newton discovered recently—Character of Flamsteed, in reference to this Controversy—of Newton, and of Halley—All of them engaged, with different objects, in studying the Lunar Theory—Newton applies to Flamsteed for Observations on the Moon—And on the Refraction of the Atmosphere, which Flamsteed transmits to him—Analysis of their Correspondence—Flamsteed's bitterness against Halley—Differences between Newton and Flamsteed—Flamsteed's ill health interferes with his supplying Newton with Observations—Newton's impatience and expostulation with Flamsteed—Justification of Flamsteed—Biot ascribes Newton's Letter to mental Illness—Refutation of this view of the subject—Newton never afflicted with any mental disorder,

108-134

CHAPTER XIX.

No mark of National Gratitude conferred upon Newton—Friendship between him and Charles Montague, afterwards Earl of Halifax—Montague appointed Chancellor of the Exchequer in 1694—He resolves upon a Re-coinage—His Letter nominating Newton Warden of the Mint in 1696—Newton appointed Master of the Mint when Montague was First Lord of the Treasury—His Report on the Coinage—Anecdote of his integrity when offered a bribe—He obtains for Halley the Deputy-Comptrollership of the Mint at Chester—Quarrels among the Officers there—Disturbances in the London Mint—New misunderstanding with Flamsteed—Remarkable Letter to him from Newton—Newton's conduct defended—The French Academy of Sciences remodelled—Newton elected one of the eight Foreign Associates—M. Geoffroy describes to Dr. Sloane the changes in the Academy—Newton resigns his Professorship and Fellowship at Cambridge—Whiston appointed his Successor—Newton elected Member for the University in 1701, and President of the Royal Society in 1705—Queen Anne confers upon him the honour of Knighthood in 1705—Love-letter to Lady Norris—His Letter to his niece, Miss C. Barton—Account of Sir William and Lady Norris—Letters of Newton about standing for the University in 1705—Letters of Halifax to Newton on that occasion—Newton and Godolphin defeated, 135-162

CHAPTER XX.

Sir Isaac is anxious to have the Greenwich Observations published—Flamsteed agrees, provided his expenses are paid—Prince George offers to pay the expense of publishing them—He appoints Sir Isaac and others Referees to manage the matter—Articles agreed upon between Flamsteed and the Referees—Differences arise, and delays in printing—The Prince offers to publish Tycho's Observations along with Flamsteed's—Newton writes to Olaus Roemer about Tycho's Manuscripts—To prevent delay the Referees propose to appoint another Corrector of the Press—Flamsteed opposes this in a Letter to Sir C. Wren—Prince George dies—The Work is stopped for three years—Flamsteed's Charges against Newton—Sanctioned by Mr. Baily—Defence of Newton—Flamsteed inserts in his Autobiography a false Copy of his Letter to Wren—The Queen appoints a Board of Visitors to superintend the Observatory—Flamsteed's Correspondence with Dr. Arbuthnot—A Scene between Newton and Flamsteed—Halley publishes the Observations printed at the expense of the Prince and the Public—Flamsteed publishes at his own expense the *Historia Celestis*—Observations on the Controversy, 163-183

CHAPTER XXI.

Dissensions in the Royal Society—Dr. Sloane and Dr. Woodward—Letter to Newton on the subject—Dr. Woodward removed from the Council—Second

edition of the *Principia*—Dr. Bentley's Letter to Newton about it—Delay of the work—Bentley's second Letter—Newton's Residences in London—Bentley announces to Newton the completion of the Second Edition—The Duke D'Aumont elected F.R.S.—Deslandes' account of a Dinner Party at Newton's—Origin of the Royal Observatory at Greenwich—Prince Menzickoff elected F.R.S.—Petition to Parliament for a Bill to promote the Discovery of the Longitude—Evidence of Newton—His Conduct misrepresented by Whiston and Biot—The Bill passes both Houses of Parliament—Dissensions in the Government—Offer of a Pension to Newton—Death of Queen Anne—Accession of George I.—Earl of Halifax Prime Minister—Death of Halifax—His Will—His affection for Miss Catherine Barton, Newton's Niece—Her intimacy with Swift—Her Character defended, . . . 184-213

CHAPTER XXII.

Leibnitz attacks Newton's Philosophy—Newton's Reply—Leibnitz attacks the English Philosophy as irreligious, in Letters to the Princess of Wales—The King requests Newton to defend himself—He claims the Invention of Fluxions—Dr. Clarke defends the English Philosophy—The Dispute carried on through the Princess of Wales—Insincerity of Leibnitz—His Death—His Eloge by Fontenelle, who apologizes to Chamberlayne for a mistake adverse to Newton—Newton's Observations on the Eloge—Varignon reconciles Newton and John Bernoulli—Newton's Correspondence with Varignon, whose views are favourable to Leibnitz—Newton asks Varignon's Opinion on the *Commercium*—His Criticisms upon it—His Death—Correspondence between Newton and John Bernoulli—Montmort's views on the Fluxionary Controversy—Nicolas Bernoulli's Letter to Newton—Letters of Dr. Smith, Dr. Derham, and Fontenelle, referred to, . . . 219-235

CHAPTER XXIII.

The Princess of Wales obtains from Newton a manuscript Abstract of his System of Chronology—The Abbé Conti, at her request, is allowed to take a Copy of it under promise of Secrecy—He gives a Copy to M. Freret of the French Academy, who writes a Refutation of it, and gives it to a Bookseller, who asks Newton's permission to print it—Newton neglects to answer two Letters on the subject—The Abstract and the Refutation of it printed—Newton reprobates the conduct of Conti, and defends his System—It is attacked by Father Souciet, and is defended by Halley—Sir Isaac's larger work on Chronology published after his Death, and dedicated to the Queen by Mr. Conduitt—Pope assists in writing the Dedication—Opinions respecting the Chronology—Sir Isaac's Paper on the Form of the most Ancient Year—His unpublished Papers on the Julian Year, and the Reformation of the Calendar, . . . 236-246

CHAPTER XXIV.

	PAGE
Theological Writings of Newton—Their importance to Christianity—Motives to which they have been ascribed—Biot's opinion disproved—The date of Newton's Theological Writings fixed—His Letters to Locke on these subjects—History of his Account of two Corruptions of the Scriptures—His Observations on the Prophecies of Daniel, and on the Apocalypse—Abstract of his Historical Account of two Corruptions of Scripture—His views adopted by the ablest Biblical Critics of modern times—His unpublished theological writings—Paradoxical Questions concerning Athanasius—His Irenicum or Ecclesiastical Polity tending to Peace—His Views on points of Trinitarian Doctrine—His Articles of Faith—His Plan for correcting the Romish tendencies of the Church of England—Coincidence of his Opinions with those of Locke—His Views on the Future Residence of the Blest—Opinions of Voltaire and Others—Napier, Boyle, Milton, and Locke, students of the Scriptures—Analogy between the Book of Nature and that of Revelation—Letter of Dr. Morland to Newton,	247-287

CHAPTER XXV.

Sir Isaac's early study of Chemistry—And of Alchemy, as shown in his Letter to Mr. Aston—His Experiments on the Metal for Reflecting Telescopes—His Chemical Pursuits between 1683 and 1687—His Researches on the Quantities and Degrees of Heat, written after his illness in 1693—His Experiments on the Rarefaction of Air, Water, and Linseed Oil—His Paper on the nature of Acids—The Results of his Chemical Researches, published among his Queries in his Optics—His Opinion on Fire and Flame—On Elective Attractions—Manuscript Works on Alchemy left among Sir Isaac's Papers—A belief in Alchemy prevalent in Newton's time—Boyle, Locke, and Newton studied Alchemy as a Science, others for fraudulent purposes,	288-302
--	---------

CHAPTER XXVI.

Newton's first attack of ill health, and his recovery—History of his acquaintance with Dr. Pemberton, who superintends the third edition of the Principia—Their Correspondence—Improvements in the third edition—Change in the celebrated Scholium—And in the Scholium on the Motion of the Moon's Nodes—Demonstration of Machin and Pemberton—Publication of the third edition—Newton attacked with the Stone—Conduitt acts for him in the Mint—His Letter recommending Colin Maclaurin as Assistant to Gregory—His Liberality on this occasion—Maclaurin's Letter to Newton—Visit of the Abbé Alari to Newton—His acquaintance with Samuel Crell—He presides at the Royal Society on the 2d March—His	b

APPENDIX TO VOLUME II.

No. I.—1. Letter from the Abbé Conti to Brook Taylor,	347
2. Letter from the Abbé Conti to Sir Isaac Newton,	349
II.—Letter from John Bernoulli to M. Remond de Montmort,	350
III.—Letters from A. B. [James Wilson, M.D.], to Sir Isaac Newton,	353
IV.—Letter from Mr. Newton to Dr. Thomas Burnet,	357
V.—Part of a Letter from Mr. Newton on Flamsteed's Speculations respecting the Sun, the Action of Heated Magnets, and the Motion of Comets,	362
VI.—Letter from Mr. Newton to Dr. Covel,	365
VII.—Letter from John Locke to Mr. Newton,	366
VIII.—Letter from Dr. Bentley to Mr. Newton,	367
IX.—Letter from Samuel Pepys to Mr. Newton,	372
X.—1. Letter from Dr. John Mill to Mr. Newton,	373
2. Letter from Mr. Newton to Dr. John Mill,	374
XI.—Table of Refractions sent by Flamsteed to Newton,	375
XII.—Letter from Mr. Flamsteed to Mr. Newton,	376
XIII.—Articles of Agreement between Churchill, Flamsteed, and the Referees,	378
XIV.—Cancelled and substituted paragraphs in a Letter of Flamsteed's,	381
XV.—Account of the Expenses incurred by the Prince's Referees, and also of those incurred by the Government in completing the <i>Historia Cœlestis</i> , as edited by Halley,	382
XVI.—Letter from Sir Isaac Newton to Mr. Flamsteed,	384
XVII.—Letter from M. Montmort to Brook Taylor,	385

CONTENTS.

	PAGE
No. XVIII.—Extracts from Swift's Letters to Stella, in which Mrs. Barton and Lord Halifax are mentioned,	386
XIX.—1. Letter from Varignon to Newton,	388
2. Letter from Newton to Varignon,	389
XX.—Letter from John Bernoulli to Newton,	392
XXI.—1. Letter from Brook Taylor to Sir Isaac Newton,	396
2, 3. Letters from M. Montmort to Brook Taylor,	398
XXII.—Letter from James Stirling to Sir Isaac Newton,	401
XXIII.—Letter from Fontenelle to Sir Isaac Newton,	402
XXIV.—Letter from Dr. Derham to Sir Isaac Newton,	403
XXV.—Letter from Pope to Mr. Conduitt,	404
XXVI.—Letters from Dr. Burgess, Bishop of Salisbury, to Sir David Brewster, on Newton's Religious Opinions,	406
XXVII.—Irenicum; or Ecclesiastical Polity tending to Peace,	407
XXVIII.—Quæries regarding the Word <i>ὁμοούσιος</i> ,	411
XXIX.—De Metallo ad Consciendum Speculum Componendo et Fundendo,	413
XXX.—Alterations and Additions made in the Third Edition of the Principia,	414
XXXI.—Observations on the Family of Sir Isaac Newton,	419
XXXII.—Letter from Sir Isaac Newton to a Friend,	425
INDEX,	429

MEMOIRS

OF THE

LIFE AND WRITINGS OF SIR ISAAC NEWTON.

CHAPTER XV.

Nicolas Facio de Duillier attacks Leibnitz—Leibnitz appeals to Newton—He reviews Newton's "Quadrature of Curves," and accuses him of Plagiarism—Newton's opinion of the Review—Dr. Keill defends Newton as the true Inventor of Fluxions, and apparently retorts the charge of Plagiarism on Leibnitz, who complains to the Royal Society—Keill explains his Defence—The Royal Society approves of his Explanation—Leibnitz calls Keill an Upstart, and begs the Royal Society to silence him—The Society appoints a Committee to inquire into the Claims of Leibnitz and Newton—The Committee report to the Society, who publish the result in the "Commercium Epistolicum"—Instigated by Leibnitz, John Bernoulli attacks the Report, and asserts, in a private letter to Leibnitz, that he was the first Inventor of the new Calculus—Leibnitz circulates this Letter in a *Charta Volans*, and gives up Bernoulli as the Author of it—Keill replies to this Letter, and attacks Bernoulli as its Author, who solemnly denies it to Newton—Leibnitz attacks Newton in a Letter to the Abbé Conti—Newton replies to it—The Controversy excites great interest—Leibnitz urges Bernoulli to make a Public Declaration in his favour—Bernoulli sends to Leibnitz the celebrated Letter "Pro Eminente Mathematico," on condition of his Name being kept secret—Leibnitz and Wolf alter this Letter improperly, and publish it in such a form, that Bernoulli is proved to be its Author—Bernoulli is annoyed by the discovery, and endeavours, by improper means, to evade the truth—The Abbé Varignon reconciles Newton and Bernoulli—Death of Leibnitz—Newton writes a History of the Calculus—General view of the Controversy, and of the conduct of the parties.

NICOLAS FACIO DE DUILLIER, a Genevise by birth, came to England in the spring of 1687, and, with the exception of a visit to Switzerland in 1699, 1700, and 1701, remained there during the rest of his life. He had become acquainted with the celebrated Huygens at the Hague in 1686, and had attained

to such a proficiency in mathematics, that he was introduced to Sir Isaac Newton, and visited him at Cambridge in the month of November 1692. Though only in the 28th year of his age, his health was precarious, and he seems to have consulted Newton on the subject of his spiritual as well as of his bodily condition. On his return from Cambridge, he caught a severe cold, which affected his lungs, and gave him great alarm. In communicating to Sir Isaac an account of his symptoms, he says, "I thank God that my soul is extremely quiet, in which you have had the chief hand;" and fearing that his illness would prove fatal, he expresses the "wish that his eldest brother, a man of an extraordinary integrity, should succeed him in his friendship." Sir Isaac answered this letter in course of post, making inquiries about his brother, and telling Facio that he remembered him in his prayers. In his reply, Facio gave him his most humble thanks, both for his prayers and his kindness,—requested him thus to remember him as long as he lived, and assured him that he always remembered him in a similar manner.¹

¹ Nicolas Facio de Duillier, an eminent mathematician, was born at Basle on the 16th February 1664. In 1684 and 1685 he became acquainted with Count Fenil, a Piedmontese, who, having incurred the displeasure of the Duke of Savoy, took refuge in France, where he became captain of a troop of horse. Having quarrelled one day with the commanding officer of his regiment, when drawn up on parade, the Count shot him dead, and, being well mounted, escaped from his pursuers. He fled to Alsace, where he took refuge in the house of Mr. Facio's maternal grandfather; but, in order to assist him more effectually, he was sent to the house of Facio's father, who lived at Duillier. When walking alone with young Facio, the Count told him that he had offered to M. De Louvois to seize the Prince of Orange, and deliver him into the hands of the King; and he showed him the letter of M. Louvois, offering him the King's pardon, approving of the plan, and enclosing an order for money. The Prince of Orange was in the habit of taking a drive on the sands at Scheveling, a village three miles from the Hague, and the Count proposed, with the aid of ten or twelve men, to land in a light ship with Dutch colours, and carry off the Prince to Dunkirk. The scheme was ripe for execution in 1686; but Facio, aware of the Count's design to take the life of his son, felt it his duty to thwart him in the commission of the two crimes which he had in view. He had become acquainted with Dr. Burnet at Geneva, and knowing that he was going to Holland to visit the Prince of Orange, he acquainted the doctor with the Count's scheme, and agreed to accompany him to Holland with the view of explaining it to the Prince. The scheme was accordingly communicated to the Prince and Princess, and, though

Having been elected a Fellow of the Royal Society in 1687, he took an active part in its proceedings, and communicated papers to its *Transactions*. In the year 1699 he published a tract entitled a "Geometrical Investigation of the Solids of least Resistance," in which he made the following reference to the history of the new calculus.¹

"The celebrated Leibnitz may perhaps inquire how I became acquainted with the calculus which I use. About the month

seconded by the latter, Monsieur Fagel and others had great difficulty in inducing the Prince to have the protection of a guard when he went abroad. In return for the services of Facio, it was resolved, on the strength of testimonials from Huygens, to create for him a professorship of mathematics for instructing the nobility and gentry of Holland, with a salary of 1200 florins, and a pension from the Prince.

Some delay having taken place in completing this arrangement, Facio got leave to pay a visit to England, where he arrived in 1687; but having been taken ill at Oxford, elected a Fellow of the Royal Society in 1687, and treated with much kindness by the English mathematicians, he remained till the accession of William III. When he visited Switzerland in 1699, 1700, and 1701, he learned that Count Fenil had received from the French Court a situation at Pignerol, a fortified city not far from Turin; and that in consequence of having conspired to surrender the place to the Duke of Savoy, he was condemned to be beheaded. In 1732, Facio endeavoured, but we believe unsuccessfully, to obtain, through the influence of Mr. Conduitt, some reward for having saved the life of the Prince of Orange. He assisted Conduitt in making out the design, and writing the inscription, for Newton's Monument in Westminster Abbey.

In 1704, when Facio taught mathematics in Spitalfields, he unfortunately became secretary to the Camisards, or fanatical prophets from the Cevennes, who pretended to raise the dead, and perform other miracles. Lord Shaftesbury attacked them in his *Letter on Enthusiasm*; and having been unjustly suspected of some political scheme, Facio and other two prophets were seized by the police in 1707, and condemned to the pillory. On the 2d of December 1707, Facio stood on the pillory at Charing Cross with the following inscription on his hat: "Nicolas Facio convicted for abetting Elias Moner in his wicked and counterfeit prophecies, and causing them to be printed and published to terrify the Queen's people." It is stated by Spence (*Observations, Anecdotes, &c.*, 1820, p. 159), on the authority of Lockier, Dean of Peterborough, "that Sir Isaac Newton had a strong inclination to go and hear the French prophets, and was restrained from it with difficulty by some of his friends, who feared he might be infected by them as Facio had been." Facio spent the rest of his life at Worcester, where he died in 1753, nearly ninety years of age.—See *Phil. Trans.* 1713, and *Gentleman's Magazine*, 1737, 1738.

¹ Dr. Guhrauer, in his biography of Leibnitz, published in 1842, has most unjustly stated that Newton prompted this attack of Facio. We have carefully inspected all the manuscripts of Newton, and cannot discover the slightest evidence in support of a charge which deserves the severest reprobation.

of April, and the following months in the year 1687, and subsequent years, when nobody, as I thought, used such a calculus but myself, I invented its fundamental principles, and several of its rules. Nor would it have been less known to me if Leibnitz had never been born. He may, therefore, boast of other disciples, but certainly not of me. And this would be sufficiently evident if the letters which passed between me and the illustrious Huygens were given to the public.¹ Compelled by the evidence of facts, I hold Newton to have been *the first inventor* of the calculus, and the earliest by several years: And whether Leibnitz, *its second inventor*, has borrowed anything from him, I would prefer to my own judgment that of those who have seen the letters of Newton and copies of his other manuscripts. Nor will the silence of the more modest Newton, or the active exertions of Leibnitz in everywhere ascribing the invention of this calculus to himself, impose upon any person who shall examine these documents as I have done."²

Strong as these expressions are, they cannot be regarded as charging Leibnitz with plagiarism. He is styled *the second inventor*, the title with which he, on many occasions, expressed himself satisfied, and he is blamed only for everywhere ascrib-

¹ These letters do not appear in the Correspondence of Huygens with Leibnitz and the other distinguished men of the seventeenth century, lately published by Professor Uyenbroek. There are no letters dated between 1680 and 1690; but it appears from a letter to Leibnitz from Huygens, dated 18th November 1690, that he was acquainted with the calculus of Facio above referred to, and that it had been the subject of correspondence between these two celebrated mathematicians. Huygens tells Leibnitz that he had some share in the rule of Facio, and that it was Facio who first pointed out the mistake of Tschirnhaus. He adds that his method was a very beautiful one; and Uyenbroek, in a note on the subject, pointing at what Huygens had done in the matter, speaks of it as a fine invention. In a subsequent letter, dated 26th April 1690, Leibnitz pays a high compliment to Facio. "As Facio has much penetration," he says, "I expect from him fine things when he comes to details; and having profited by your instruction and that of Newton, he will not fail to produce works which will gain him distinction. I wish I were as fortunate as he is in being able to consult two such oracles." See *Christiani Huygenii, aliorumque seculi xvii. virorum celeberrimorum. Exercit. Math. et Philos.* Fascic. i. p. 41, and Fascic. ii. pp. 56, 175. Hagæ Comitum, 1833.

² *Investigatio Geometrica, &c.*, p. 18. Lond. 1699.

ing the invention to himself. In replying to Facio,¹ Leibnitz appealed to Newton himself as having stated, in the celebrated scholium, that the new calculus was common to them both, and that neither had received any light from the other;² and, without disputing or acknowledging the priority of Newton's claim, he asserted his own right to the discovery of the differential calculus. Facio sent a reply to the editors of the *Acta Eruditorum*, but they refused to print it on the ground of their aversion to controversy.³ The controversy therefore terminated for the present, and the contending parties laid down their arms, ready to resume them on the slightest provocation.

When Newton published his Treatise on the Quadrature of Curves, along with his Optics, in 1704, he mentioned in his preface that he had gradually found the method of fluxions in the year 1665 and 1666. A review of this work, by Leibnitz,⁴ but without his name, was published in the *Acta Eruditorum* for January 1705. After giving an imperfect analysis of its contents, he compared the method of fluxions with the differential calculus, and, in a sentence of some ambiguity, he states that Newton employed fluxions in place of the differences of Leibnitz, and made use of them in his Principia in the same manner as Honoratus Fabri, in his Synopsis of Geometry, had substituted progressive motion in place of the indivisibles of Cavalieri. As Fabri, therefore, was not the inventor of the method which is here referred to, but borrowed it from Cavalieri, and only changed the mode of its expression, there can be no doubt that the artful insinuation contained in the above passage was intended to convey the impression that Newton

¹ *Acta Eruditorum*, 1700, p. 203.

² We have already proved that Newton did not attach this meaning to his scholium; and, in replying to this passage in the *Recensio Commercii Epistolici*, he himself distinctly denies having "acknowledged that Leibnitz invented his method by his own genius, unassisted by the letters of Newton."—*Newtoni Opera*, tom. iv. p. 489.

³ *Acta Eruditorum*, 1701, p. 134.

⁴ Guhrauer, the biographer of Leibnitz, proves that he was the author of the review, and affirms that Leibnitz constantly denied any knowledge of the authorship.—See *Essays from the Edinburgh Review*, by Henry Rogers, pp. 226, 227.

had *stolen* his method of fluxions from Leibnitz. That this was the view of it taken by the friends of Newton will presently appear. That it was the view taken by Newton himself we are fortunately able to prove from the following passage in his own handwriting,¹ which is so important that we copy it without any other change than the use of Leibnitz's own words.

“In the *Acta Eruditorum* for 1705,² an account of the Introduction to the Book of Quadratures was published in these words:—‘Quæ [Isagoge or Preface] ut MELIUS intelligatur, sciendum est, cum magnitudo aliqua continue crescit, veluti linea, (exempli gratia) crescit fluxu puncti, quod eam describit, incrementa illa momentanea [producta] appellavi DIFFERENTIAS, nempe inter magnitudinem quæ antea erat et quæ per mutationem momentaneam est producta; atque hinc natum esse calculum Differentialem, eique reciprocum summatorium,³ cujus elementa ab INVENTORE Dn. Godefrido Guilelmo Leibnitio in his actis sunt tradita, variique usus tum ab ipso, tum a Dnn. Fratribus Bernoulliis, tum et Dn. Marchione Hospitalio sunt ostensi. Pro Differentiis Igitur Leibnitianis Dn. Newtonus adhibet, semperque [pro iisdem] adhibuit fluxiones, iisque tum in suis Principiis Naturæ Mathematicis, tum in aliis postera editis [pro Differentiis Leibnitianis] eleganter est usus, QUEMADMODUM ut Honoratus Fabrius in sua synopsi Geometrica motuum progressus Cavallerianæ methodo SUBSTITUIT.’ And all this is as much as to say that I did not invent the method of fluxions in the years 1665 and 1666, as I affirmed in this Introduction, but that after Mr. Leibnitz, in his letter of 21st June 1677, had sent me his differential method, instead of that method, I began to use, and have ever since used, the method of fluxions.”⁴

¹ *A Supplement to the Remarks*, p. 6.

² January, p. 34.

³ This was the name given by Leibnitz to the integral calculus, or the inverse method of fluxions.

⁴ The words within brackets are added by Newton, and bring out very distinctly the meaning of Leibnitz. In his letter to the Abbé Corti, dated 9th April 1716, Leibnitz virtually admits the authorship of the review, endeavours to give a different meaning

That Newton was virtually accused of plagiarism by the reviewer, cannot, we think, admit of a doubt. The indirect and ambiguous manner in which the charge is couched, and the artful reference to the case of Fabri and Cavalieri, make it doubly reprehensible; and we are persuaded that no candid reader can peruse the passage without a strong conviction that it justifies, in the fullest manner, the indignant feelings which it excited among the English philosophers. If Leibnitz, in place of being the author of the review, had been merely a party to it, he merited the full measure of rebuke which was dealt out to him by the friends of Newton, and deserved those severe reprisals which doubtless embittered the rest of his days. He who dares to accuse a man like Newton, or indeed any man holding a fair character in society, of the odious crime of plagiarism, places himself without the pale of the ordinary courtesies of life, and deserves to have the same charge thrown back upon himself. The man who conceives his fellow to be capable of such intellectual felony, avows the possibility of himself committing it, and almost substantiates the weakest evidence of the worst accusers.

Dr. Keill, as the representative of Newton's friends, could not brook this concealed attack upon his countryman. In a letter on the Laws of Centripetal Forces, addressed to Halley, and printed in the Philosophical Transactions for 1708,¹ he stated that Newton was "beyond all doubt" the first inventor of fluxions; and he asserted "that the same calculus was afterwards published by Leibnitz, the name and the mode of notation being changed." If the reader is disposed to consider this passage as retorting the charge of plagiarism upon Leibnitz, he will readily admit that the mode of its expression is neither so coarse nor so insidious as that which is used by

to the words *semperque adhibuit*, and maintained that Newton allowed himself to be deceived by a man who poisoned his words, and sought a quarrel by the malignant interpretation of them. Newton was himself the interpreter. See Raphson's *History of Fluxions*, p. 103.

¹ For September and October, p. 185.

the writer in the *Acta Eruditorum*. In a letter to Hans Sloane, dated 4th March 1711, Leibnitz complained to the Royal Society of the treatment he had received. "Nobody, says he, "knew better than Newton that this charge is false, for certainly I never heard of the name of the *Calculus of Fluxions*, nor saw with these eyes the characters which Newton used." He expressed his conviction that Keill had erred more from rashness of judgment than from any improper motive. He did not regard the accusation as a calumny; and he requested that the Society would desire Mr. Keill to disown publicly the injurious sense which his words might bear. When this letter was read to the Society, Keill justified himself to Sir Isaac Newton and the other members, by showing them the obnoxious article on the Quadrature of Curves in the *Acta Eruditorum*, and they all agreed in attaching the same injurious meaning to the passage in the review. The discussion excited so much interest, that, on the 5th April 1711, Newton gave, from the chair of the Society, "a short account of his invention, with the particular time of his first mentioning or discovering it; ¹ upon which Mr. Keill was desired to draw up an account of the matter in dispute, and set it in a just light."² This account, contained in a letter to Sir Hans Sloane, was read at the Society on the 24th May 1711, and a copy of it was ordered to be sent to Leibnitz. In this letter, which is

¹ This account was probably given to the Society in consequence of the following unpublished letter from Keill to Newton, written two days before the meeting, that is on the 3d April 1711:—"I have now sent you the *Acta Lipsiæ* (1705), where there is an account given of your book (on Quadratures), and I desire you will read from page 34, &c. (namely, the passage which we have given from Newton's MS. in pages 3, 4). I hold not the volume (1710, p. 78) in which Wolfius has answered my letter, but I have sent you his letter transcribed from thence, and also a copy of my letter to him. I wish you would take the pains to read that part of their supplements, wherein they give an account of Dr. Friend's book, and from them you may gather how unfairly they deal with you; but really these things are trifles, not worth your while, since you can spend your time to much better purpose than minding anything such men can say. However, if you would look upon them so far as to let me hold your sentiments on that matter, you will much oblige, your most humble servant, JO. KEILL."

² Weld's *History of the Royal Society*, vol. i. p. 410.

one of considerable length, Dr. Keill declares that he never meant to state that Leibnitz knew either the name of Newton's method or the form of notation, and that the real meaning of the passage was, "that Newton was the first inventor of fluxions, or of the differential calculus, and that he had given, in two letters to Oldenburg, and transmitted to Leibnitz, indications of it sufficiently intelligible to an acute mind,¹ from which Leibnitz derived, or was able to derive, the principles of his calculus."

The charge of plagiarism which Leibnitz thought was implied in the former letter of his antagonist, is here greatly modified, if not altogether denied. Keill expresses an *opinion* that the letters *seen* by Leibnitz contained intelligible indications of the fluxionary calculus, from which he either derived, or might derive, the principles of his calculus. Even if this opinion were correct, it is no proof that Leibnitz either saw these indications, or availed himself of them; or if he did perceive them, it might have been in consequence of his having previously been in possession of the differential calculus, or having enjoyed some distant view of it. Leibnitz should, therefore, have allowed the dispute to terminate here; for no ingenuity on his part, and no additional facts, could affect an opinion which any other person as well as Keill was entitled to maintain.²

¹ "Indicia perspicacissimi ingenii viro satis obvia, unde Leibnitius principia illius calculi hausit aut haurire potuit."

² These sentiments, which we had formerly expressed, and which we again repeat, have been singularly misrepresented by Dr. Guhrauer in his *Life of Leibnitz*. A distinguished writer (Mr. Henry Rogers), in giving an account of this work, has defended us better than we could have done ourselves. "Dr. Guhrauer," he remarks, "is not a little indignant with Sir David Brewster for the supposed injustice which, in his *Life of Newton*, he has done to Leibnitz, and to which he frequently refers with much bitterness. Never was a complaint more unreasonable. Our distinguished countryman does not question Leibnitz's claim to be regarded as a true inventor of the calculus; he merely asserts the undoubted *priority* of Newton's discovery. He expressly affirms that there is no reason to believe Leibnitz a plagiarist; but that if there were any necessity for believing either to be so, it must be Leibnitz, and not Newton, who is open to the charge. Guhrauer angrily replies, not simply by saying (which is true) that there

Leibnitz, however, took a different view of the subject, and wrote a letter to Sir Hans Sloane, dated December 29, 1711, which excited new feelings, and involved him in new embarrassments. Insensible to the mitigation which had been kindly impressed upon the supposed charge against his honour, he alleges that Keill had attacked his candour and sincerity more openly than before; that he acted without any authority from Sir Isaac Newton, who was the party interested; and that it was in vain to justify his proceedings by referring to the provocation in the *Acta Eruditorum*, because, in that journal, *no injustice had been done to any party, but every one had received what was his due.* He asserts that he discovered the calculus *some years before he published it, that is in 1675, or earlier.* He brands Keill with the odious appellation of an upstart, and one little acquainted with the circumstances of the case;¹ and he calls upon the Society to silence his vain and unjust clamours,² which, he believed, were disapproved by Newton himself, who was well acquainted with the facts, and who, he was persuaded, would willingly give his opinion on the matter.

is no sufficient evidence of Leibnitz's having stolen Newton's invention, but by denying the essential identity of the two methods, and by affirming that they are so different as to be considered 'unlike things,' than which nothing can, in our judgment, be more uncandid.

"There is only one statement which, as respects Leibnitz, Dr. Gubrauer could fairly find fault with in Sir David Brewster's work; and that is, that Keill had a 'right to express his opinion' that the letters of Newton of 1676 gave indications from which Leibnitz 'derived, or might derive,' the principles of his calculus. For reasons already assigned, we do not think that any man *had a right to say this*, nor that any one could say it without being *of a different opinion from Newton himself*, who undoubtedly must have thought that he had not disclosed what he designed to conceal. With no other statement of Sir David Brewster, as regards Leibnitz, are we disposed to find fault."—*Essays from the Edinburgh Review*, by Henry Rogers, vol. i. pp. 227, 228. *Edin. Review*, vol. lxxxiv. pp. 43, 44. Mr. Rogers has certainly misapprehended the meaning of our statement, which amounts to nothing more than that Dr. Keill, or any other man, had a right to express his opinion on any subject whatever, whether they are sound or unsound. We have already proved that the opinion of Keill was the opinion of Newton himself, and, as he knew this, he had a right of a higher kind to express the same opinion.

¹ Homo doctus, sed novus, et parum peritus rerum anteaclarum cognitor.

² Vanæ et injustæ vociferationes.

This unfortunate letter was doubtless the cause of all the rancour and controversy which so speedily followed, and it placed his antagonist in a new and a more favourable position. It may be correct, though few will admit it, that Keill's second letter was more injurious than the first; but it was not true that Keill acted without the authority of Newton, because Keill's letter was approved of, and transmitted, by the Royal Society, of which Newton was the president, and therefore became the act of that body. The obnoxious part, however, of Leibnitz's letter, consisted in his appropriating to himself the opinions of the reviewer in the Leipsic Acts, by declaring that, in a review which charged Newton with plagiarism, every person had got what was their due. The whole character of the controversy was now changed: Leibnitz places himself in the position of the party who had first disturbed the tranquillity of science by maligning its most distinguished ornament; and the Royal Society was imperiously called upon to throw all the light they could upon a transaction which had exposed their venerable president to so false a charge. The Society, too, had become a party to the question, by their approbation and transmission of Keill's second letter, and were on that account alone bound to vindicate the step which they had taken.

When the letter of Leibnitz, therefore, was read, Keill appealed to the registers of the Society for the proofs of what he had advanced. Sir Isaac also expressed his displeasure at the obnoxious passage in the *Acta Eruditorum*, and at the defence of it by Leibnitz, and he left it to the Society to act as they thought proper.

In this emergency, a committee of the Royal Society was appointed on the 6th March 1712, "to inspect the letters and papers relating to the dispute, consisting of Dr. Arbuthnot, Mr. Hill, Dr. Halley, Mr. Jones, Mr. Machin, and Mr. Burnet." Mr. Robarts, a contributor to the Transactions, was added to the committee on the 20th of March, M. Bonet, the Prussian Minister, on the 27th, and Mr. De Moivre, Mr. Aston, and

Dr. Brook Taylor, on the 17th of April.¹ The committee, thus constituted, was instructed to examine the registers of the Society, and to lay before it such documents as they might discover, with their own opinions on the subject. This committee, probably from being called *consessus arbitratorum*, has been supposed to have been a judicial committee; but, as Professor De Morgan has shown, and as Newton himself has asserted, it had no such character, since none of Leibnitz's friends were placed upon it, and no invitation given him to produce documents in his defence. The committee consisted entirely of Newton's friends; and several of them, though qualified to attest the genuineness of the documents in the report, were not fitted, by their mathematical acquirements, to give an opinion on the subject.²

On the 24th of April the committee gave in the following report, which was in the handwriting of Halley:—

“We have consulted the letters and letter-books in the custody of the Royal Society, and those found among the papers of Mr. John Collins, dated between the years 1669 and 1677 inclusive; and showed them to such as knew and avouched the hands of Mr. Barrow, Mr. Collins, Mr. Oldenburg, and Mr. Leibnitz; and compared those of Mr. Gregory with one another,

¹ The additions thus made at different times to the original committee, were first pointed out by Professor De Morgan, and were unknown to all preceding writers. The discovery was a very important one, as it had been asserted by Newton that the committee was a numerous one, consisting of persons of different nations, which was certainly not the character of the original committee. As Professor De Morgan has been led, after an anxious examination of the subject, “to differ from the general opinion in England as to the manner in which Leibnitz was treated,” his defence of Newton's veracity was a graceful contribution, and cannot fail to give weight to his other opinions.—See his paper in the *Philosophical Transactions*, vol. xlvi. pp. 107-109.

² “There may have been,” says Professor De Morgan, “and I often suspect there was, something of truth in the surmise of Leibnitz, who thought that the near prospect of the Hanoverian succession created some dislike against the subject and servant of the obnoxious Elector on the minds of the Jacobite portion of English science.” “*Amicus Anglus ad me scribit,*” says Leibnitz, “*videri [eos qui parum Domui Hanoveranæ favent] aliquibus non tam et Mathematicos et Societatis Regiæ Socios in Socium, sed ut Toryos in Whigium quosdam egesse.*”—*Philosophical Transactions*, 1846, p. 108. Newton himself was a *Whig*, and a friend of the House of Hanover.

and with copies of some of them taken in the hand of Mr. Collins ; and have extracted from them what relates to the matter referred to us ; all which extracts herewith delivered to you, we believe to be genuine and authentic ; and by these letters and papers we find,—

“ I. That Mr. Leibnitz was in London in the beginning of the year 1673 ; and went thence, in or about March, to Paris ; where he kept a correspondence with Mr. Collins, by means of Mr. Oldenburg, till about September 1676, and then returned by London and Amsterdam to Hanover : and that Mr. Collins was very free in communicating to able mathematicians, what he had received from Mr. Newton and Mr. Gregory.

“ II. That when Mr. Leibnitz was the first time in London, he contended for the invention of another differential method, properly so called, and notwithstanding that he was shown by Dr. Pell, that it was Mouton's method, he persisted in maintaining it to be his own invention, by reason that he had found it by himself, without knowing what Mouton had done before, and had much improved it. And we find no mention of his having any other differential method than Mouton's, before his letter of 21st June 1677, which was a year after a copy of Mr. Newton's letter, of the 10th December 1672, had been sent to Paris to be communicated to him ; and above four years after, Mr. Collins began to communicate that letter to his correspondents ; in which letter the method of fluxions was sufficiently described to any intelligent person.

“ III. That by Mr. Newton's letter of the 13th June 1676, it appears that he had the method of Fluxions above five years before the writing of that letter, and by his Analysis, *per Equationes numero Terminorum Infinitas*, communicated by Dr. Barrow to Mr. Collins in July 1669, we find that he had invented the method before that time.

“ IV. That the differential method is one and the same with the method of fluxions, excepting the name and the mode of notation ; Mr. Leibnitz calling those quantities differences, which

Mr. Newton calls moments or fluxions ; and marking them with the letter *d*, a mark not used by Mr. Newton. And therefore we take the proper question to be, not who invented this or that method, but who was the first inventor of the method ; and we believe, that those who have reputed Mr. Leibnitz the first inventor, knew little or nothing of his correspondence with Mr. Collins and Mr. Oldenburg long before ; nor of Mr. Newton's having that method above fifteen years before Mr. Leibnitz began to publish it in the *Acta Eruditorum* of Leipsic.

“ For which reasons we reckon Mr. Newton the first inventor ; and are of opinion that Mr. Keill, in asserting the same, has been noways injurious to Mr. Leibnitz. And we submit to the judgment of the Society, whether the extracts and letters and papers now presented, together with what is extant to the same purpose, in Dr. Wallis's third volume, may not deserve to be made public.”

This report being read and agreed to, the Society unanimously adopted it, ordered the collection of letters and manuscripts to be printed, and appointed Dr. Halley, Mr. Jones, and Mr. Machin, to superintend the press. Complete copies of it, under the title of *Commercium Epistolicum D. Johannis Collins et aliorum de analysi promota*, were laid before the Society on the 8th January 1713 ; and Sir Isaac Newton, as president, ordered a copy to be delivered to each person of the Committee appointed for that purpose, to examine it before its publication.¹

According to Leibnitz, he received information of the appearance of the *Commercium Epistolicum* when he was at Vienna, and “ being satisfied, as he expresses it, that it must contain *malicious falsehoods*, I did not think proper to send for it by post, but wrote to M. Bernoulli to give me his sentiments.”²

¹ This work was not published for sale, and as the few copies of it which were printed were chiefly distributed as presents, it became so scarce that Raphson tells us “ it was not to be met with among the booksellers.” Twenty-five copies were disposed of to a bookseller at the Hague. See Edleston's *Correspondence*, Notes, p. lxxiii.

² Newton states that a copy of the *Commercium* was sent to Leibnitz by the Resident

M. Bernoulli wrote me a letter, dated at Basle, June 7, 1713, in which he said, *that it appeared probable that Sir Isaac Newton had formed his calculus after having seen mine.*"¹ This letter was published in Latin, by Leibnitz, with reflections, in a loose sheet, entitled *Charta Volans*, dated July 29, 1713, and was widely circulated, without either the name of the author, printer, or place of publication, and giving the names of N—n and L—z, with their initial and final letters.

The origin of this letter is curious and instructive. In writing to Leibnitz on the 28th February 1713, Bernoulli says, that he has informed Newton of some of his mistakes,² but in a very gentle manner, that he might not give offence to one who had been very kind to him in getting him elected a Fellow of the Royal Society, and as showing much attention to his son when in London. In Leibnitz's reply of the 16th March, he remarks that Newton wishes to ingratiate himself with him, and he adds, we shall see what can be elicited from the correspondence with Collins, which, owing to his absence from home, he may not see so early as he will. Bernoulli had now received from Paris a copy of the *Commercium Epistolicum*, and in replying to Leibnitz on the 7th of June he gives him a general account of the Report of the Committee, and adds in a couple of pages his own opinion of it, which constitutes the celebrated letter of the 7th June 1713, inserted by Leibnitz in the *Charta Volans*. He concludes the letter by imploring Leibnitz "to make a right use of what he has written, and not compromise him with Newton and his countrymen, as he was unwilling to be mixed up with these controversies."³ In spite of this request, Leibnitz not only gave up Bernoulli as the author of the letter, but

of the Elector of Hanover, above a year before this, and several copies to Leipsic, one of which was for him. MS.

¹ Letters to the Count de Bothmar in Des Maizeaux's *Recueil de Diverses Pièces*, &c. tom. ii. p. 44.

had insidiously inserted in a parenthesis, and in the same type, as if it had been written by the author, the words, *as was long ago remarked by a certain eminent mathematician*, which placed Bernoulli in the ridiculous position of praising himself.

Previous to the publication of the *Charta Volans*, Dr. Keill sent to the *Journal Littéraire* for 1713,¹ some remarks on the controversy, with the Report of the Committee, and Newton's important letter to Collins, dated 10th December 1672. An anonymous answer,² but certainly written by Leibnitz, appeared in the same work for November and December 1713. It contained a French translation of the *Charta Volans*, and of the letter of a very eminent mathematician, dated 7th June 1713, on the subject of the controversy, the same letter which Leibnitz mentions to Count Bothmar, as the production of Bernoulli.³ In this letter Bernoulli asserts that Newton in his researches confesses that he never even thought of Fluxions, and had not invented them before the differential calculus. He maintains that he was ignorant, when he wrote the *Principia*, of the true way of taking the fluxions of fluxions, and he accused him of having deprived Hooke and Flamsteed of their just honours, the one for his hypothesis of the planets, and the other for the use of his observations.

Newton was indignant at this new attack upon his character, which was sent to him in the autumn of 1713, by Mr. Chamberlayne, who then kept a correspondence with Leibnitz, and he immediately drew up a sharp reply,⁴ which was probably

¹ For May and June, pp. 208-217.

² *Remarques sur le Différent entre M. de Leibnitz et M. Newton*, November and December 1713, pp. 445-453.

³ This letter, in the Latin edition of it in the *Charta Volans*, referred, as we have stated, to Bernoulli, in the sentence *quemadmodum ab eminente quodam mathematico dudum notatus est*. The reference was continued in the French edition; but in another edition of the *Charta Volans*, which Leibnitz published two years afterwards in the *Nouvelles Littéraires*, December 28, 1715, p. 414, he omitted the above passage, as if to fix the authorship on Bernoulli; and in a letter to Madame Kilmansegg, dated April 1716, he inserted a copy of the obnoxious letter, without the passage referred to, and without any hesitation ascribed it to Bernoulli.

⁴ There are several copies of this paper among Newton's manuscripts.

sent to Keill, as the groundwork of his long and elaborate answer, which appeared in the *Journal Littéraire* for July and August 1714.¹ Bernoulli was supposed by both to be the very eminent mathematician² who wrote the letter of the 7th June 1713, and but for Leibnitz's indiscretion, his name would never have been known. Never doubting that Bernoulli was the author, Keill endeavoured to prove it, and exposed with great severity the incorrectness and injustice of his charges against Newton. Notwithstanding the repeated declarations of Leibnitz, that Bernoulli was the author of this letter, Bernoulli himself disavowed it to M. Des Maizeaux, to M. Montmort, and to the Abbé Varignon; and in a letter to Newton, dated 10th July 1719, he declared that he was not the author of it, and that too with such solemnity that Newton believed him, and would not listen to Keill and his other friends when they expressed an opposite opinion. "I beseech you," says he,³ and I adjure you, by all

¹ This paper, occupying forty-two pages, was drawn up with great care with the assistance of Sir Isaac, four of whose letters to Keill on the subject, dated April 2, 20, May 11, 15, 1714, have been published by Mr. Edleston. I have now before me the originals of six letters from Keill to Newton, dated May 2, 17, 19, 21, and June 29, 1714. In Newton's letter of April 2, he says that Keill "need not set his name to it." In Keill's reply of the 2d May, sending a part of his answer, he says, that "he never saw a bad cause defended with so much face and impudence before." He is to take Leibnitz "to task for filching of series," and he is "for putting his name to it;" for he adds, "I have said nothing but what is fully made out, and they have, on the contrary, thrown all the dirt and scandal they could without proving anything they have said, and therefore they thought it best to conceal their names. I believe Wolfius is the author of the Latin letter, for it is exactly agreeable to his caution and honesty, who is inferior to nobody but Mr. Leibnitz in prevarication. Dr. Halley and I do often drink your health. He and I are both of opinion that there should be fifty copies of the *Commercium* sent over to Johnson (the publisher of the *Journal Littéraire*, to whom they were subsequently sent), and that there should be advertisements in the foreign Gazettes, that the original letters of the *Commercium* are in such a man's hands, to be viewed by gentlemen that are to travel in England, and particularly the letter with Gregory's quadrature of the circle." In his letters of the 25th and 29th June, he sends "the whole of his answer to Bernoulli and the Leipsic rogues, for you and Dr. Halley to change or take away what you please."

² Leibnitz had not at this time written the letter to Bothmar or Madame Kilmansegg, declaring that Bernoulli was the author of it.

³ "Fallunt haud dubie qui me tibi detulerunt tanquam auctorem quarundam ex

that is sacred, that you will firmly believe that anything published without a name, in which a sufficiently honourable mention of you has not been made, has been falsely imputed to me. . . . Far be it from me to believe that Leibnitz, that truly excellent man, wished to deceive you by mentioning me. It is more credible that he was deceived either by his own conjecture or that of others, and yet he was not altogether blameless, in so far as he rashly and imprudently committed to writing anything of which he had no knowledge." The dishonesty of Bernoulli, thus placed beyond a doubt, is equalled only by the dishonourable conduct of Leibnitz in betraying his friend.¹ Anxious to obtain the opinion of a great mathematician in favour of his own claims, and against those of Newton, he asked Bernoulli, as we have seen, to do him this favour. This request of his patron and friend was readily granted, but under the obligation that his name should be concealed. Leibnitz, however, was not satisfied with this anonymous tribute to his genius, and did not scruple to obtain for it all its value by violating his word, and exposing his friend to the enmity of Newton, and the keen shafts of Keill, of which we shall presently see he stood in great alarm. During the interval between the date of Bernoulli's letter, namely, the 7th June, and that of the *Charta Volans*, in which Leibnitz published it, namely, the 29th July 1713, he seems to have felt how little was the value of the anonymous testimony which he had received; he therefore writes to Bernoulli on the 28th June, "that he expects from his justice and candour that he will, as

Schedis istis volantibus, in quibus forsā non satis honorifica tui fit mentio. Sed obsecro te, vir inclyte, atque per omnia humanitatis sacra obtestor ut tibi certo persuadeas, quicquid hoc modo sine nomine in lucem prodierit, id mihi falso imputari. . . . Absit autem ut credam Leibnitium, virum sane optimum me nominando fucum vobis facere voluisse. Credibile namque potius est ipsum vel sua vel aliorum conjectura fuisse deceptum. . . . Non tamen omni culpa vacabit quod tam temere et imprudenter aliquid proscripserit cujus nullam habebat notitiam."—See APPENDIX, No. XX.

¹ The late John Bernoulli, speaking of the conduct of Leibnitz to his grandfather, says, *Il commit l'indiscrétion de le trahir.*—*Mém. Acad. Berlin*, 1799, 1800. *Hist.* p. 41.

soon as possible, declare *publicly* among his friends, when the opportunity occurs, that the *Calculus of Newton was posterior to his.*"¹ In replying to this letter, Bernoulli assures him that he will conceal nothing either among his friends or publicly, when the occasion demands it, and he comforts Leibnitz by saying that his fate was like that of his prince, the Elector of Hanover, whom the villanous English wished to deprive of the succession to the kingdom, in the same manner as they wished to deprive him of the possession of his calculus. Leibnitz, however, was very uneasy on the subject. He was anxious to know what the Parisians thought, for though he had no doubt that Varignon would be his friend, he feared that others would take the opportunity of attacking him.² He expresses the hope, however,³ in a letter containing some severe strictures on Newton, that Varignon would take care, Bernoulli prompting him, that nothing was done in France of which he might complain.

This extreme sensitiveness, on the part of Leibnitz, we can readily excuse, but we can find no apology for his conduct in betraying so ardent a friend as Bernoulli. On a future occasion we shall find him prompting the German mathematician to another act of hostility against Newton and Keill, and a second time divulging the secret under which the favour was granted. And at the very close of his career, when his great powers had been appreciated by the world, and an immortality of reputation was dazzling his failing sight, he did not scruple to conspire with Wolf, another German mathematician of feeble morality, to vitiate a letter of Bernoulli, and leave a shadow

¹ The passage is curious, and it is obvious that the editor has omitted a part of the letter unfit for the public eye. "Satis apparet Newtonum id egisse suis blanditiis, ut benevolentiam tuam captaret; conscium sibi quam non recto stent talo quæ molitus est. Ego tamen etsi nolim, ut in mei gratiam tibi negotium facessas, *expecto tamen ab equitate tua et candore, ut profitearis apud amicos quam primum, et publice data occasione, calculum Newtoni nostro posteriorem tibi videri.*" . . .—*Commercium Phil. et Math. G. G. Leibnitii et J. Bernoullii*, tom. ii. pp. 313, 314.

² *Ibid. Ibid.* tom. ii. p. 314.

³ *Ibid. Ibid.* pp. 320, 321.

upon his name which the lustre of his genius will never be able to efface.

Amid the feelings excited by the letter of *the eminent mathematician*, Mr. Chamberlayne, whom we have already mentioned as the correspondent of Leibnitz, conceived the design of reconciling the two distinguished philosophers; and, in a letter, dated April 28th, 1714,¹ he addressed himself to Leibnitz, who was still at Vienna. In replying to this letter, Leibnitz declared that he had given no occasion for the dispute; "that Newton procured a book to be published, which was written purposely to discredit him, and sent it to Germany, France, and Italy, as in the name of the Society;" and he stated "that there was great room to doubt whether Newton knew his invention before he had it from him." Mr. Chamberlayne communicated this letter to Sir Isaac Newton, who replied, that Leibnitz had attacked his reputation in 1705, by intimating that he had borrowed from him the method of fluxions; that if Mr. C. could point out to him anything in which he had injured Mr. Leibnitz, he would endeavour to give him satisfaction; that he would not retract things which he knew to be true; and that he believed that the committee of the Royal Society had done no injustice by the publication of the *Commercium Epistolicum*. In another letter, Leibnitz expressed his entire disapprobation of the report of the committee, and of the *Commercium*, declaring at the same time, more than a year and a half after two copies had been sent to him, that *he had not yet seen the book published against him*, and requesting Mr. Chamberlayne to submit his letter to the Society.

When the letter was laid before a meeting of the Society on the 20th of May 1714, they came to the following resolution:—

"It was not judged proper (since this letter was not directed to them) for the Society to concern themselves therewith, nor were they desired so to do. But if any person had any mate-

¹ See Des Maizeaux, tom. ii. p. 116.

rial objection against the *Commercium*, or the report of the committee, it might be re-considered at any time."

This resolution was sent to Leibnitz, who, in a letter to Chamberlayne, dated 25th August 1714, justly observes that the Society "did not pretend that the report of the committee should pass for a decision of the Society."¹ Along with the resolution, Mr. Chamberlayne sent to Leibnitz Sir Isaac's letter and Dr. Keill's answer to the papers inserted in the *Journal Littéraire*, and, after perusing them, he replied, "that Sir Isaac's letter was written with very little civility; that he considered it *non scripta*, as well as the piece printed in French (by Dr. Keill); that he was not in a humour to put himself in a passion against such people; that there were other letters among those of Oldenburg and Collins which should have been published; and that on his return to Hanover he would be able to publish a *Commercium Epistolicum*, which would be of service to the history of learning." When this letter was read to the Royal Society, Sir Isaac remarked that the last part of it injuriously accused the Society of having made a partial selection of papers for the *Commercium Epistolicum*; that he

¹ Mr. Weld, in his *History of the Royal Society*, vol. i. p. 415, and *Phil. Mag.* July 1847, p. 35, states that Professor De Morgan and I have committed a curious and grave mistake in adopting this opinion of Leibnitz; and that it was at the request of some of our most eminent philosophers that he corrected the mistake by publishing the resolution of the Society, as, if our views of the resolution were adopted, "a strong case would be made out against Newton." The Society never adopted the Report, in the sense of adopting, as a body, the opinion of their committee. They simply agreed to receive it, and ordered it to be printed. *His autem die Aprilis 24, 1712, acceptis. Societas Regia Collectionem, &c. &c., imprimi jussit.* The cause of Newton was not affected by the adoption of the Report as their decision, and the resolution to re-consider it can mean nothing more than to express their willingness, which Newton himself often did, to receive any new information from Leibnitz or his friends, and even to publish it in the Transactions. That Newton himself was of the opinion which we have been maintaining, is proved by a passage in his *Remarks* on Leibnitz's letter to Conti, where he says, in the month of May 1716, "If they (the Royal Society) have not yet given judgment against him, it is because the committee did not act as a jury, nor the Royal Society as a formal court of justice." . . . "And it is sufficient that the Society ordered their report, with the papers upon which it is grounded, to be published."—Raphson's *Fluxions*, p. 112.

did not interfere in any way in the publication of that work, and had even withheld from the committee two letters, one from Leibnitz in 1693, and another from Wallis in 1695, which were highly favourable to his cause.¹ He stated that he did not think it right for Mr. Leibnitz himself to publish a *Commercium Epistolicum*, but if he had letters to produce in his favour, that they might be published in the *Philosophical Transactions*, or in Germany.

About this time the Abbé Conti, a noble Venetian, came to England. He was a correspondent of Leibnitz, and in the postscript of a letter which he had received from him soon after his arrival,² and written in November or December 1715, he enters upon his dispute with Newton. He charges the English with "wishing to pass for almost the only inventors." He declares "that Bernoulli has judged rightly in saying, that Newton did not possess before him the infinitesimal characteristic and algorithm." He remarks that Newton preceded him only in series; and he confesses that during his second visit to England, "Collins showed him part of his correspondence," or, as he afterwards expresses it, he saw "some of the letters of Newton at Mr. Collins's." He represents the metaphysics of the English as narrow (*bornée*), and their mathematics as common or superficial. He then attacks Sir Isaac's philosophy, particularly his opinions about gravity and a vacuum, the intervention of God for the preservation of his creatures; and he accuses him of reviving the occult qualities of the schools. But the most remarkable passage in the letter is the following: "I am a great friend of experimental philosophy, but Newton deviates much from it *when he pretends that all matter is heavy*, or that each particle of matter attracts every other particle." The letter concludes with a problem, which he requests Conti to propose, "in order to feel the pulse of the English analysts."

¹ Published in Raphson's *History of Fluxions*, pp. 119, 121, and in the *Addimenta Com. Epist.*, *Newtoni Opera*, tom. iv. pp. 614, 615.

² It is published in Raphson's *History of Fluxions*, p. 97.

Under these circumstances, and influenced by the advice of Keill, which we have already mentioned, Sir Isaac became anxious that foreigners of distinction should see the original papers which had been preserved in the archives of the Society, and compare them with the other letters of Leibnitz. He therefore requested the Abbé Conti to assemble the ambassadors and other foreign ministers for this purpose, and when they had met in the apartment of the Society and collated the papers, the Baron de Kilmansegg, the Hanoverian minister, remarked that this measure was not a sufficient one, and that the right way of terminating the dispute was that Newton himself should write a letter to Leibnitz, stating to him "his reasons," and demanding a direct answer to them. All the ministers who were present approved of this suggestion, and the king, to whom it was mentioned in the evening, gave it his hearty approbation.

Conti reported these proceedings to Sir Isaac, and in five or six days he received a letter from him, dated February 26, 1715-16, to be sent to Leibnitz, who was then in Hanover. As this letter was addressed to Conti, he enclosed it in one of his own, dated — March 1716, which he had previously read to Newton. Mr. Demouivre had corrected it, and added the part which related to the equivocal manner in which Leibnitz had proposed the problem for the English analysts. The letter of Conti, with Newton's enclosed, which was to be taken to Hanover by the Baron de Discau, remained more than a month in London. Madame de Kilmansegg had it translated into French. The king read it, and approved of it so highly as to say, that the reasons were very simple and clear, and that it would be difficult to reply to the facts.¹

This letter of Newton's was the first occasion on which he appeared in the controversy in his own person. Reluctantly driven into the field, he did not hesitate to give utterance to

¹ These facts are stated in a very interesting letter from Conti to Brook Taylor, dated May 21, 1721. It was published in the *Memoirs* of Brook Taylor, p. 121, and is of such importance that we have given it in APPENDIX, No. I.

the opinions which had been maintained by Keill. In a tone of dignified severity he gave a brief notice of the controversy, and triumphantly refuted the allegations of his adversary. "Finding it impossible," he says, "to reply to matter of fact, Leibnitz invoked the opinion of a mathematician or pretended mathematicians, dated 7th June 1713, and inserted it in an anonymous defamatory letter of the 29th July, which he circulated in Germany,"—a letter which had been answered by Keill, and to which no reply had been returned. He charges Leibnitz with trying to engage him in philosophical disputes, and challenging him to the solution of problems which have no relation whatever to the question in dispute; and he makes some severe observations on Leibnitz's doctrine of the *Pre-established Harmony*, which he pronounces a true miracle, and contrary to all experience. He cites a passage from Leibnitz's letter to himself, dated March 7, 1693, in which he acknowledges the value of Newton's discoveries; and he makes the following observations on that branch of the dispute which relates to Leibnitz's having seen part of Newton's letters to Mr. Collins. "He (Leibnitz) complains of the committee of the Royal Society, as if they had acted partially in omitting what made against me; but he fails in proving the accusation. He quotes a passage concerning my ignorance, pretending that it was omitted in the *Commercium Epistolicum*, and yet you will find it there in p. 74, lines 10, 11, and I am not ashamed of avowing it. He says that he saw this paragraph in the hands of Mr. Collins when he was in London the second time, that is in October 1676; and as this is in my letter of the 24th of October 1676, he therefore then saw that letter. And in that and some other letters writ before that time, I described my method of fluxions; and in the same letter I described also two general methods of series, one of which is now claimed from me by Mr. Leibnitz." The letter concludes with the following paragraph: "But as he has lately attacked me with an accusation which amounts to plagiary; if he goes on to

accuse me, it lies upon him by the laws of all nations to prove his accusations, on pain of being accounted guilty of calumny. He hath hitherto written letters to his correspondents full of affirmations, complaints, and reflections, without proving anything. But he is the aggressor, and it lies upon him to prove the charge."

In transmitting this letter to Leibnitz, the Abbé Conti informed him that he himself had read with great attention, and without the least prejudice, the *Commercium Epistolicum*, and the little piece¹ that contains the extract ; that he had also seen at the Royal Society the original papers of the *Commercium Epistolicum*, and some other original pieces relating to it. "From all this," says he, "I infer, that, if all the digressions are cut off, the only point is, whether Sir Isaac Newton had the method of fluxions or infinitesimals before you, or whether you had it before him. You published it first, it is true, but you have owned also that Sir Isaac Newton had given many hints of it in his letters to Mr. Oldenburg and others. This is proved very largely in the *Commercium*, and in the extract of it. What answer do you give ? This is still wanting to the public, in order to form an exact judgment of the affair." The Abbé adds, that Mr. Leibnitz's own friends waited for his answer with great impatience, and that they thought he could not dispense with answering, if not Dr. Keill, at least Sir Isaac Newton himself, who had given him a defiance in express terms. In the close of his letter he informs Leibnitz that several geometers in London and Oxford have solved his problem, and he tells him that he will take some other opportunity of speaking to him of Newton's philosophy, which has been greatly misapprehended.

¹ This is the *Recensio Commercii Epistolici*, or an abstract or review of it. It occupies forty-one quarto pages, and has a preface *Ad Lectorem*. It was written by Sir Isaac Newton, a fact which Professor De Morgan had deduced from a variety of evidence. It was first published in the *Phil. Trans.* 1715, in English, was reprinted in *Newtoni Opera*, tom. iv. p. 445, and in the *Journal Littéraire*, tom. vii. pp. 113, 345. See *Phil. Mag.* June 1852.

Leibnitz was not long in replying to the request of the Abbé Conti, and the defiance of Newton. He addressed a letter to the former on the 9th of April 1716, but he sent it through M. Remond de Montmort, to be communicated to the mathematicians¹ in Paris, as neutral and intelligent witnesses, and then transmitted to Conti. In the letter to the Abbé, which was dated 14th April, he tells him that he may judge from all this, if "the wicked chicanery of his new friends has greatly embarrassed him," and he closes his letter with a reference to the problem, "for feeling the pulse of the English analysts," which he tells him was proposed by Bernoulli.²

The letter of Leibnitz of the 9th April is bold and ingenious. He defends the statements in the anonymous attacks upon Newton as if they were his own. He gives an account of his two visits to London, and mentions what he there saw and learned. He charges Newton with retracting his admission in the scho-

¹ A few days after this letter was written, April 13, Leibnitz wrote to Bernoulli that the "English dispute was renewed, and that Newton, *when he saw that Keill was reckoned unworthy of an answer*, had descended into the arena." He tells him "that Newton knows that the letter (of June 7, 1713) was his, and that he had described it 'as written by a mathematician, or a *pretended mathematician*,' as if he were ignorant of your merits, calling *the whole Chart (the Charta Volans) defamatory*, as if it were more calumnious than the additions to the *Commercium Epistolicum*." In replying to this letter, on the 20th May 1716, Bernoulli considers it fortunate that Newton has descended into the arena to fight in his own name, and without a mask. He expresses much confidence in his candour, and hopes that the historical truth will now be elicited. The most curious part of the letter, however, is the following passage: "*I wonder how Newton could know that I was the author of that letter which you inserted in the Charta published against Newton, since no mortal knew that I wrote it except yourself to whom it was written, and I, by whom it was written.*" He then refers to Leibnitz's interpretation of the phrase *pretended mathematician*, as if it accused him of ignorance, and he shows very satisfactorily that it bore another meaning (the real meaning of Newton as avowed in his remarks on Leibnitz's letter), in no way derogatory from his mathematical knowledge. In Leibnitz's next letter of the 7th June, he makes no reference to Bernoulli's expression of wonder, and has not the honesty to tell him that he had himself communicated the secret to Count Bothmar, and published it. See the *Commercium Epistolicum Phil. et. Math. Leibnitii et Bernoullii*, tom. ii. pp. 375, 377, 378.

² Some time after this M. Remond de Montmort seems to have remonstrated with John Bernoulli, on the subject of defying the English analysts to the solution of problems. We do not know where this letter is to be seen, but we have found among New-

lium, and thus considers himself entitled to retract his admission in favour of Newton. He introduces again his metaphysical opinions as having been misrepresented by Newton, and he concludes by denying that he was the aggressor, and had accused Newton of plagiarism.

On the very day when Leibnitz was writing this letter, Bernoulli was engaged in composing his famous *Epistola pro Eminente Mathematico*, which has formed so curious and instructive an episode in the fluxionary controversy. He had been stung by the poignancy of Keill's reply to the *Charta Volans*, and the severity of its animadversions on the letter of his own which it contained; and, as will be seen from his own acknowledgment, he was *afraid* to encounter without a mask so bold and uncompromising an antagonist. He therefore resolved to attack Keill in an anonymous letter, addressed to Christian Wolf, one of the editors of the *Acta Eruditorum*. This letter, dated April 8, 1716,¹ which Bernoulli, the grandson, admits was particularly

ton's papers Bernoulli's reply to it written after the death of Leibnitz, and dated 8th April 1717. In this reply, which he requested Remond to send to Newton, he protests that he had neither the inclination nor the leisure to enter into disputes with the English, or to defy them. It was Leibnitz, he says, who asked him for some problem which could be proposed to the English, and particularly to Keill, and of such a nature that it required a knowledge of their methods to solve. Leibnitz asked him to keep this a secret, in order that it might some day be of use to them against those who wished to defy them. "I imagined," he says, "a problem which seemed to have the qualities he desired, and I sent him two solutions that he might propose it to the English under his own name. I had reason, therefore, to be astonished when I saw that he had given me up as the author, and proposed the problem in spite of me, and even as if it had been done at my instigation. Have the goodness then to disabuse Mr. Newton of his opinion on this matter, and assure him from me that I never had the intention of trying the English by these sort of defiances, and I desire nothing so much as to live in friendship with him, and to find an opportunity of showing him how much I esteem his rare merit. I never speak of him, indeed, without much praise. It is, however, greatly to be desired that he would take the trouble of inspiring his friend Mr. Keill with sentiments of kindness and equity towards foreigners, and leave such in possession of what really belongs to them. For to desire to exclude us from every pretension would be a crying injustice.

—See APPENDIX No. II.

¹ It was entitled *Epistola pro Eminente Mathematico, Do. Joanne Bernoullio contra quendam ex Anglia antagonistam scripta*, and was published in the *Acta Eruditorum* for July 1716, pp. 296-315.

directed against Newton, was sent to Wolf on condition of the most inviolable secrecy. It was to be first communicated to Leibnitz with power to change or omit what was necessary, and to print it as a letter from an anonymous person, or as if it were written by some other person with a real or a feigned name ; but in whatever way this was done, Wolf was directed to manage the whole matter with his usual skill, lest Keill should suspect Bernoulli to be the author ; “ for,” he adds, “ it would be very disagreeable to me to be irritated and contumeliously treated by his bile, as his antagonists usually are, after he has hitherto treated me with sufficient politeness.” Wolf expressed his great satisfaction with the attack upon “ that trifler Keill,” and promised to communicate it to Leibnitz, and decide according to his opinion on the form and manner in which it was to be published. The two critics, Wolf and Leibnitz, made such changes in the epistle as were agreeable to the latter, and every means were taken to keep the secret. Herman suspected that Bernoulli was the author of it, and, when he mentioned his suspicion, Wolf denied it, as he declares he always did ; but though every precaution was taken to keep the secret, it was discovered by means of the phrase *meam formulam*, which had been either heedlessly overlooked, or, as we believe, willingly left, in order to fix it upon Bernoulli, whose public declaration against Newton, and in favour of himself, Leibnitz had expressed his anxiety to obtain. The changes made on the letter were very considerable. M. Bernoulli, the grandson, who had a copy of the original, has published the two in opposite columns,¹ and, after a careful comparison of them, he observes, “ that not a single disobliging expression against Newton and Keill had been omitted or softened. “ It is true,” he continues, “ with respect to Keill, who was the more ill-treated, that his name was everywhere suppressed ; and when Wolf (and Leibnitz too) calls him an *audacious* antagonist in one place, where the letter only called him Keill, he did

¹ *Mém. de Berlin*, 1802, *Hist.* pp. 60-65.

worse than mention him by his name." Without noticing the fulsome praise of Leibnitz and Bernoulli, inserted in the letter, Bernoulli, the grandson, calls our attention to another point,—“to a species of fraud which Leibnitz and Wolf committed against their friend by interpolations, which they ought not to have made without his consent, seeing that they were to his disadvantage, and *had principally for their object* to claim for Leibnitz discoveries which Bernoulli attributed to himself. There can be no doubt that these interpolations were made by Leibnitz alone, for Wolf would not of his own accord have permitted them ; but he was too much devoted to Leibnitz not to adopt what was done by his great patron.”¹

Although this letter was published in July 1716, yet Bernoulli was not aware, even in the month of March 1717, of the trick that had been played him, or of the injurious interpolations which had been made in it, or, of the worst fact of all, that the words *meam formulam* proved him to be the author. It was not till he heard of Herman's conjecture that he was the author, that he was induced to read the letter, and discover these unfortunate words. He immediately saw the use which would be made of them. His friends had already been laughing at the mistake, and his enemies accusing him of being the author of the letter ; and he expressed his dread that Keill would seize every opportunity of cutting him up, and employing the matter against him for his own purposes. He, therefore, implored Wolf to think of some method of correcting the blunder in the *errata*, and he suggested that *meam* should read *eam* ; but seeing that this would not answer

¹ *Mém. Acad. Berlin*, 1799, 1800, p. 47. The interpolation here referred to as an act of Leibnitz, is one of singular dishonesty. Bernoulli, in his letter to Wolf, states that he first taught the *exponential calculus* ; but in place of this statement, they make Bernoulli say that he was only the first who *taught it publicly*, and then they add what he never said, “Far be it for me to deny that it was *first made known by Leibnitz*,”—thus making Bernoulli himself surrender his discovery to his rival.—*Mém. Acad. Berlin*, 1802, pp. 57, 58.

the purpose, he begged Wolf to think of some better method, by which the mistake should be laid upon the printer. Wolf did not obey the mandate of his friend, and, on the advice of Montmort, Bernoulli was induced to avow the letter through his son Nicolas, and to make the best apology he could by throwing much of the blame upon the friends who had deceived him. The avowal, which forms the appendix to a mathematical paper, is written in a good spirit, and concludes by expressing the ardent wish of his father, that the disputants would become good friends, and unite their powers, as citizens of the republic of mathematics, in labouring to extend its domains.¹ In concluding this strange history, in which Leibnitz performs the least creditable part, we are scarcely surprised at the fact stated by Bernoulli's grandson, that Wolf had the effrontery, in a history of his life and writings, to claim for himself the authorship of the letter *Pro Eminente Mathematico!*²

This celebrated letter, as might have been expected, excited the indignation of Newton and his friends. They had no difficulty in discovering its author ;³ and a long and elaborate reply to it, in the form of a letter to Bernoulli, was immediately prepared by Dr. Keill, and submitted to Newton, who proposed numerous alterations, and made many important additions to it. It is written with Keill's usual boldness, and ends with the following observation :—"If any person shall think that you have been treated too severely, I request them to take the trouble of reading your letter, a worthy effort of your

¹ *De Trajectoriis, &c. &c.*, in the *Acta Eruditorum*, 1718, pp. 261, 262.

² *Mém. Acad. Berlin*, 1799, 1800, pp. 41, 42.

³ In a letter to Newton, dated May 17, 1717, Keill thus speaks of it:—"A friend of mine brought me the *Acta* the other day, and I was amazed at the impudence of Bernoulli. I believe there was never such a piece for falsehood, malice, envy, and ill-nature, published by a mathematician before. It is certainly wrote by himself, for though he speaks of Bernoulli always in the third person, yet towards the latter end of his paper he forgot himself, and says that nobody but the antagonist can persuade himself that *my formula* was taken from Newton's." In a letter from Newton to Keill, May 2, 1718, he says that the *meam solutionem* "lays the letter upon Bernoulli."—See Edleston's *Correspondence*, Lett. xciii. p. 186.

genius, and then let them consider if you have not well deserved it.

“ Si pergis dicere quæ vis, audies quæ non vis.”¹

After the death of Leibnitz, which took place on the 14th November 1716, the controversy to a considerable extent ceased.² His champion Bernoulli withdrew from the field, when no longer influenced by his patron and friend; and though Newton has been charged with having made an improper attack upon Leibnitz after his death, he did nothing more than publish an answer, which had been previously in circulation among his friends, in the form of Remarks on the letter of Leibnitz to the Abbé Conti.³ This paper, which is erroneously characterized by Biot as a *bitter refutation*, is, on the contrary, an argumentative defence of his claims—an interesting notice of his own mathematical discoveries—a defence of the Royal Society and of Dr. Keill—and a frank expression of his feelings in reference to the conduct both of Leibnitz and Bernoulli.

Although Bernoulli felt the severity of Newton's censure, he was now more anxious to explain his own conduct than to

¹ We have found among Newton's papers a fair copy of this answer in French in the form of a letter to Bernoulli; and also Newton's annotations in separate folio sheets. It is doubtless another copy of the same piece which Mr. Edleston found among the Lucasian papers, and which he justly supposes to be the *libellum editum aut non editum* to which Bernoulli refers in the *Acta Eruditorum* for May 1719, p. 218, containing some vulgar and impertinent abuse of Keill as his *antagonista Scotus—homo quidem natione Scotus, qui apud suos inclaruit moribus, ita apud exteros jam passim notus odio plusquam vatiniانو quo flagrat, &c.*—See Edleston's *Correspondence*, &c. p. 178; see also Newton's letter to Keill in p. 185, and *note*, p. 186, of the same *Correspondence*.

² The death of Leibnitz was notified to Newton by the Abbé Conti, who was then at Hanover, in a letter dated 10th December 1716. “ M. Leibnitz,” he says, “ est mort, et la dispute est finie.” After mentioning the manuscripts of Leibnitz, which he hopes the King will show him, he adds, “ Je remarquerai s'il y a quelque chose touchant votre dispute, mais peut-être qu'on cachera ce qui ne fait point d'honneur à la mémoire de M. Leibnitz.”—See APPENDIX, No. III. Lett. 2.

³ These remarks, without a date, but written on the receipt of Leibnitz's letter of the 9th April, were first printed in Raphson's *Fluxions*, p. 111. They were afterwards translated into French, and published in Des Maizeaux's *Recueil*. I have found in the Portsmouth Papers the French proof, containing, in Newton's own hand, numerous corrections and several small additions to the Remarks, one of which mentions the month of May 1716 as the date when they were written.

retaliate upon his adversaries, and a few months had scarcely elapsed after the death of Leibnitz, before he sent messages of kindness to Newton. We have already seen that in April 1717, he not only threw the blame of the pulse-feeling problems upon Leibnitz, but blamed him highly for betraying the secret under which they were sent to him. In a subsequent letter from Montmort to Newton, dated 7th March 1718, he conveys similar messages from Bernoulli and his son Nicolas, expressing their fears that their disputes with Keill had deprived them of his friendship. In replying to Bernoulli, Montmort pointed out to him the inconsistency of these expressions with the *Epistola pro Eminente Mathematico*, and seems to have suggested to him the propriety of disowning it. Bernoulli, however, took a middle course. He acknowledges that he had, at Leibnitz's request, sent him the facts necessary to defend himself against Keill, and was not answerable either for the praise given to himself, or the harsh language applied to his antagonists.

When Sir Isaac received Montmort's letter, he enclosed it to Keill,¹ requesting "his sense upon this matter." In his reply,² Keill observes that Bernoulli "is sensible that he had burnt his fingers; that he should beg Newton's pardon for saying that he did not understand second differences,—that no notice should be taken of these letters," and that "it lay on Bernoulli to clear himself and produce the author of the scurrilous paper.

The celebrated Abbé Varignon had been long desirous of reconciling Newton and Bernoulli, and at last succeeded in the attempt. Sir Isaac had in 1718 sent Varignon three copies of the English edition of his *Optics*, and in 1719, as many of the Latin edition, to be presented to his friends. Varignon sent a copy of each to Bernoulli in the name of Newton,³ and

¹ This letter, dated May 2, 1718, has been published by Mr. Edleston, in his *Correspondence*, &c. in pp. 185, 186.

² In an unpublished letter, dated May 23, 1718.

³ Newton had, in 1717, sent to Nicolas Bernoulli a copy of the second edition of the *Principia*. Bernoulli's letter of thanks, dated Pavia, 31st May 1717, has been preserved.

it was in Bernoulli's reply, dated 10th July 1719, thanking him for these presents, that he gave the solemn denial we have already quoted, that he was not the author of the celebrated letter to Leibnitz of 7th June 1713. In answering this letter,¹ Newton thus expressed himself, "When I first received your letters, through the mediation of the Abbé Variignon, and understood from them that you were not the author of a certain letter to Mr. Leibnitz, dated 7th June 1713, I at once resolved not only to forget the mathematical disputes which had lately taken place, but to cultivate your friendship, and to estimate highly your great mathematical merits. I have never grasped at fame among foreign nations, but I am very desirous to preserve my character for honesty, which the author of that epistle, as if by the authority of a certain great judge, had endeavoured to wrest from me. Now that I am old, I have little pleasure in mathematical studies, and I have never tried to propagate my opinions over the world, but have rather taken care not to involve myself in disputes on account of them."

The dignified tone of this letter could not fail to disturb the tranquillity of Bernoulli. Conscious of having written the letter which Newton condemns as an attack upon his honesty, he could hardly avoid referring to it in his reply, and we cannot but regret that the terms in which he again denies it are essentially different from those which he had used only five months before.² "I am not aware," says he, "of the nature of the letter to Leibnitz, dated 7th June 1713, of which you speak. I do not remember that I wrote to him on that day, nor do I altogether deny it, as I do not keep copies of my letters. But if, perhaps, among the innumerable letters which I have written to him, one should be found to which the said day and year is prefixed, I dare solemnly assure you, that nothing is contained in it which could in any way injure your character, and that I never gave

¹ We quote from the Latin scroll, which has no date, and of which there are two copies among the Portsmouth Papers.

² See p. 17.

him leave to publish any of my letters, and especially one which would not be agreeable to you. I implore you, therefore, to be persuaded, that I never intended to speak of you otherwise than as a great man, and much less to attack your character and probity."

The letter of Newton, to which this was the reply, was enclosed in one to Varignon,¹ in which he thanks him for having reconciled him to Bernoulli, and mentions as the ground of his embracing him as a friend, his denial of having written the obnoxious letter to Leibnitz. Varignon was much gratified at having brought about this reconciliation, but it was a reconciliation merely nominal, and led only to a few interchanges of civility.—Bernoulli sought an explanation through Varignon, of the charge of knight errantry which Newton had made against Leibnitz and his "army of disciples," for challenging the English to the solution of mathematical problems. Newton explained that the phrase was used in a jocular sense, and applied to Leibnitz ;² and we believe that no farther communication took place between them till 1723, when Newton sent Bernoulli a copy of the French edition of his Optics.³ In returning thanks for this present, Bernoulli takes occasion to introduce for the *third* time the subject of the celebrated letter of the 7th June 1713. Hartsoecker, a Dutch philosopher, had attacked Newton's Theory of Colours, and had referred to him as his authority for charging Bernoulli with having called himself "an excellent mathematician" in the *Charta Volans*. After directing the attention of Newton to the attack upon his Theory of

¹ This letter, of which an imperfect scroll has been published in the *Macclesfield Correspondence*, vol. ii. p. 436, as a letter from Newton to —, is supposed by Mr. Edleston to have been addressed to Montmart. The copy which I have found is a fuller and more perfect scroll than the one published by Mr. Rigaud.—See Edleston's *Correspondence*, &c. p. 187, note.

² Letter of Newton to Varignon, September 26, 1721.

³ This work was translated by M. Coste and corrected by the Abbé Varignon, whose correspondence with Newton relates principally to certain difficulties which arose with the publisher, and to Newton's reconciliation to Bernoulli.

Colours, Bernoulli denies the truth of the charge against himself without distinctly denying, as he formerly did, the authorship of the letter, and seems to expect that Newton should take some step in the matter. "Although the fellow," says he, "is unworthy of any answer from me, yet one thing irritates me greatly, namely, that he exposes me to the laughter of every person, and impudently maintains that I took to myself the title of an excellent mathematician; and in order that the crime of calumny should not attach to himself, he makes you the author of it by citing the passage in which you speak of that letter of 7th June 1713, which Leibnitz maintained was written by me, and in which that eulogium, within parentheses, was ascribed to me. Hence the calumniator maliciously concludes that you wished to insinuate that I had been so arrogant as to assume this title to myself. . . . In the meantime, whatever be the calumny of Hartsoecker, it applies more to you than to me, for he malignantly endeavours to draw it from your express words. What you think should be done, therefore, that my innocence may be protected among those who do not see the Collection of Des Maizeaux,¹ I would willingly learn from yourself, if you are disposed to honour me with an answer."²

In the year 1725, a new edition of the *Commercium Epistolicum* was published, with notes, a general review of it,³ and a preface of some length. A question has arisen respecting the authorship of the review and the preface, some ascribing them to Keill, and others to Newton. From similarity of style, but chiefly on the authority of Dr. James Wilson, the friend of Pemberton, Professor De Morgan had made it highly probable that both the review and the preface were written by Newton.⁴ Of the correctness of this opinion I have found ample evidence

¹ "Des Maizeaux, *Recueil de Diverses Pièces*, &c. tom. ii. p. 125, line 32."

² Dated Basle, Feb. 6, 1723.

³ This review is the *Revisio*, mentioned in page 25, note.

⁴ *Phil. Mag.* June 1852, vol. iii. p. 440.

in the manuscripts at Hurtsbourne Park;¹ and it is due to historical truth to state, that Newton supplied all the materials for the *Commercium Epistolicum*, and that, though Keill was its editor, and the committee of the Royal Society the authors of the Report, Newton was virtually responsible for its contents.

The share which Newton took in the fluxionary controversy either directly or through Dr. Keill, who did nothing without his approbation, and the mass of papers which he has left behind him on the subject, show the great anxiety which he felt not only to be considered the first inventor of the calculus, but the only inventor who had a right to the reputation which it gave. He firmly believed, not only that Leibnitz might have derived the differential calculus from the papers actually communicated to him, but that he did derive it from that source, or from his ideas either oral or written, which were in circulation at the time of his visit to London.² That these were the views of Newton, and, we may add, of all his friends in England, is evident from the new form given to the celebrated scholium in the third edition of the *Principia*, which appeared in 1725, under the editorship of Pemberton. The reference to Leibnitz and his method was wholly omitted, and replaced by a quotation from a letter to Collins in December 1672, containing, or supposed to contain, the Germ of Fluxions. This step was perhaps unwise. The statement in the two first editions granted nothing to Leibnitz, and even if it had, the truth which it embodied was not cancelled by its omission from the third; but viewing the matter as Newton did, we think he was justified in omitting the scholium. He had stated it, as he himself has

¹ I find among these MSS. scrolls of almost the whole of the *Recensio*, and five or six copies in his own hand of the *Ad Lectorem*.

² In reference to this subject, I find two remarkable letters addressed to Newton in 1720, by Dr. James Wilson, mentioning to him that he possessed several of his manuscripts, and had seen others which had been in general circulation. "Among the papers," he says, "I likewise observed there were some which deduced even the first principles of geometry from the fluxion of points." These letters seem to me of such importance, that I have given them in the APPENDIX, No. III.

said, as a mere historical fact, that Leibnitz had sent him a method which was similar to his own; and when he found that the German mathematician had regarded this simple statement as a recognition of his independent discovery of the calculus, he was not only entitled but constrained to cancel a passage which had been so erroneously interpreted, and so improperly used.

Some time after the death of Leibnitz, Newton drew up a *History of the Method of Fluxions*, the Preface to which has been found among his papers. I am disposed to think that this Preface was intended as an Introduction to the new edition of the *Commercium Epistolicum* and *Recensio*, which was published in 1725, and that it had not been thought advisable to enter into any fresh discussions on the subject. In the first paragraph of the Preface, Sir Isaac remarks, that as only a few copies of the *Commercium* had been published and sent to those only who could judge in such matters, that work and the *Recensio* should be again printed, in order that a true history of the calculus, drawn from ancient documents, might descend to posterity without any disputes, and “put an end to a controversy which was no longer necessary after the charge of plagiarism had been repelled.” He then proceeds to enumerate by their dates *seventeen* letters from Leibnitz to Oldenburg, written between the 3d February 1673 and the 12th July 1677; and, after establishing his claim to the invention of the new calculus, he concludes with these words: “These things being premised, the *Recensio* of the *Commercium Epistolicum* should be read, and the *Commercium* itself consulted, if any doubt be entertained respecting the facts.”

The following is an exact copy of the title-page of the manuscript: ¹—

¹ In the first copy of this manuscript the word *Prefatio* is not inserted after the title *Historia*, &c. In the second it is inserted, and the title erased; and in the third the title is omitted, and the word *Prefatio* alone inserted. Newton seems to have had much difficulty in fixing upon a title. Upon a separate folio which I have found, occupying a page and a half, there are no fewer than *twelve* forms of it. The first is *Introductio ad Recen-*

In studying this controversy, after the lapse of nearly a century and a half, when personal feelings have been extinguished, and national jealousies allayed, it is not difficult, we think, to form a correct estimate of the claims of the two rival analysts, and of the spirit and temper with which they were maintained. The following are the results at which we have arrived :—

1. That Newton was the first inventor of the *Method of Fluxions* ; that the method was incomplete in its notation ; and that the fundamental principle of it was not published to the world till 1687, twenty years after he had invented it.

2. That Leibnitz communicated to Newton, in 1677, his *Differential Calculus*, with a complete system of notation, and that he published it in 1684, three years before the publication of Newton's Method.

sionem Libri, &c., but all the rest are *Historia Methodi, &c.*, with eleven variations. In the second, third, and fourth, it is *Historia Methodi Analyseos, &c.* In the fifth and sixth the names of both the mathematicians are omitted. In the seventh it is *Historia Methodi Differentialis*, with both names omitted. In the eighth the change is remarkable. The title is *Historia Methodi Analyseos per Fluxiones et Momenta a D. Newtoni inventa, a D. Leibnitio Differentialis nominata, ex literis antiquis deducta*. In the ninth, tenth, and eleventh, it is *Hist. Meth. Fluxionum, &c.* ; and in the twelfth *Differentialis* is placed above *Fluxionum*.

The admission of these two facts ought to satisfy the most ardent friends of the rival inventors ; but in apportioning to each the laurels which they merit, new considerations have been introduced into the controversy. Conscious of his priority, Newton persisted in maintaining that the only question was, who was the *first* inventor, and that “ *second* inventors have little or no honour, and no rights.”¹ Upon this principle, which we cannot admit, the whole merit of the new calculus must be given to Newton, and he undoubtedly claimed it. But at variance with this, there is another principle maintained in modern times, and by distinguished men, which transfers all the merit of an invention or discovery to the person who first gives it to the world. Upon this principle the merit of the new calculus must be adjudged to Leibnitz. These two extreme principles have not in the present case been adopted by the mathematical world. No writer has urged the second against the claims of Newton, or the first against those of Leibnitz. Priority of invention may be established otherwise than by publication ; and the merit of a second inventor, when really such, is intellectually as great as the first.² There is a merit, however, of a peculiar kind which must ever attach to the first inventor who freely gives his invention to the public. While society concedes to him a high niche in the temple of fame, it cherishes also a feeling of gratitude for the gift it has received. To a second inventor society owes but its respect and admiration.

Hitherto we have taken it for granted that Newton and Leibnitz had borrowed nothing from each other ; and, in stating the result of our inquiry, we have supposed this to be true. A very different opinion, however, has been maintained during the

¹ “ *Secundis Inventoribus, etiam revera talibus, vel exiguus ve nullus honor, tituli vel juris nihil est.*”—*Recensio, Newtoni Opera*, tom. iv. p. 487.

² We cannot here discuss this important subject. Such of our readers as take an interest in it, are referred to the *North British Review*, vol. vii. p. 233, &c., where it is treated in reference to the rival claims of Adams and Leverrier.

controversy. The unquestioned priority of Newton's discoveries has preserved him from the charge of having borrowed anything from Leibnitz, excepting his ideas of notation ; but a variety of circumstances, which it is unnecessary to mention, have given a certain degree of plausibility to the opinion that Leibnitz may have derived assistance, even of the highest kind, from the previous labours of his rival. At an early period Newton had communicated to his friends, orally and in writing, the elements, or the germ of his method of fluxions, but certainly his discoveries in series. His manuscripts were copied, and, to a considerable extent, circulated in England. The letters and extracts, actually communicated to Leibnitz, may, or may not, have contained the information which Newton and his friends considered as sufficient to convey to him a knowledge of the method of fluxions ; but the fact that he was twice in England in 1673 and 1676, and was in communication with the mathematicians who then adorned the metropolis, justified the idea that either orally, or from the circulated manuscripts¹ of Newton casually seen, or actually communicated to him, he might have derived that information.²

Had Leibnitz been an ordinary man, these views might have had much weight ; but his powerful intellect, his knowledge of the subject, and the great improvements which he made in the new calculus, place it beyond a doubt that he was capable of inventing the differential method without any extraneous aid. His *Theoria Motus Abstracti*, dedicated to the Academy of Sciences in Paris in 1671, before he visited England, contains, according to Dr. William Hales,³ "no obscure seeds of his differential method ;" and shows, in the opinion of Professor De Morgan, "that in 1671 it was working in Leibnitz's mind,

¹ See APPENDIX, No. III.

² We have made no reference to the singular opinion of Raphson and of Dr. James Wilson, that Leibnitz may have deciphered the anagram in which Newton concealed his method. See APPENDIX, No. III.—P.S. to letter of January 21, 1720-1. See also Professor De Morgan's paper in the *Companion to the Almanac for 1852*, p. 15.

³ *Analysis Fluxionum*, p. 2, § 5.

that in the doctrine of infinitely small quantities lay the true foundation of that approach to the differential calculus which Cavalieri presented."¹ Another argument in favour of Leibnitz is deduced by Professor De Morgan from seven MSS. of his, bearing the dates of November 11, 21, 22, 1675; and June 26, July, and November 1676, one bearing no date, and recently published by M. Gerhardt from the originals in the Royal Library at Hanover.² These MSS., of which Professor De Morgan has given a specimen, are, as he says, "study exercises in the use of both the differential and integral calculus,"³ and, if genuine, and correct in their dates, possess a historical interest.

In adjudicating on a great question like the present, surrounded as it has been with national sympathies, we are compelled to look into the character of the parties at our bar. We cannot commend the conduct of Newton in concealing from Leibnitz, in transposed letters, the discoveries which he had made, nor can we justify his personal retreat from the battlefield, and his return under the vizard of an accomplished champion.⁴ His representatives, however, were men of station and character, who gave their names, and staked their reputation in the contest; while Leibnitz and his disciples wielded the anonymous shafts of the slanderer, denied what they had written, and were publicly exposed through the very rents which they had left in their masks.

Instead of striving to prove that he was the inventor of the new calculus, Leibnitz evaded the discussion by attacking the

³ *Ibid.* p. 17. See vol. i. p. 358, note 4.

⁴ Dr. Keill, Newton's principal champion, and who so nobly fought his battles, has been ungenerously treated by some of the historians of science. With his private letters to Newton before us, we have formed a high opinion both of his talents and character. Everything he did was open and manly, and he did nothing without the instruction and approbation of Newton and his friends.

philosophy of Newton, which he did not understand, and challenging the English to the solution of mathematical problems. Nor were these problems his own. He obtained them, as we have seen, under the pledge of secrecy, from a friend whose name he did not scruple to betray ; and, when the controversy was at its crisis, he tried to substitute authority for argument, by imploring the most distinguished mathematician on the Continent to declare that he was the first and the sole inventor of the new calculus. Bernoulli rashly yielded to the urgency of his patron, but, in the anonymous testimonial which he gave, Leibnitz inserted a parenthetic eulogy on the writer, which had the effect of removing his mask, and exposing him to the ridicule and laughter of the scientific world. Nor is it difficult to discover, or uncharitable to expose, the motive for the interpolation. It was intended to prove that the " eminent mathematician " was John Bernoulli, and, lest the proof should not be thought sufficient, Leibnitz publicly declared, while Bernoulli as publicly denied, that he was the author. Thus, to a certain extent, baffled in his schemes, Leibnitz, as we formerly stated, implored Bernoulli, when an opportunity should present itself, to make an early and public declaration that the method of fluxions was posterior to his calculus—that is, that Newton was a plagiarist. An opportunity soon occurred for the perpetration of this fresh act of injustice. Bernoulli unscrupulously prepared the document,¹ and, when it came into the hands of Leibnitz, he imparted to it new elements of bitterness,—interpolating passages in praise of himself and Bernoulli,—altering other passages, so as to give to himself a discovery which belonged to his friend,—and, finally, leaving the words *meam formulam* to prove, as it did prove, to the world, that the testimony in the letter was the testimony of John Bernoulli. We have found nothing in the records of science so dishonest as this. As a portion of

¹ His celebrated letter of the 9th April 1716, already described. See p. 26, and APPENDIX, No. II. An instructive account of an instance of bad faith towards Leibnitz, on the part of Bernoulli, is given by his own grandson in the *Mém. Acad. Berlin*, 1802, pp. 51-56.

scientific history, closely connected with the fluxionary controversy, we have submitted it to the reader ; but we have not allowed it to influence the decision which we have ventured to pronounce.

In charging Newton with plagiarism, and in persuading others to repeat and enforce the charge, we may find some apology in the excited feelings of Leibnitz, and in the insinuations which were occasionally thrown out against the originality of his discovery ; but for other parts of his conduct, we seek in vain for an excuse. When he assailed the philosophy of Newton in his letters to the Abbé Conti, he exhibited only the petty feelings of a rival ; but when he dared to calumniate that great and good man in his correspondence with the Princess of Wales, by whom Newton was respected and loved,—when he ventured to denounce his philosophy as physically false and dangerous to religion,—and when he founded these accusations on passages in the *Principia* and *Optics*, glowing with all the fervour of genuine piety, he cast a blot upon his name which all his talents as a philosopher will never be able to efface.¹

¹ This anecdote is given in still stronger language by M. Biot in his *Life of Newton*, *Biog. Univers.* tom. xxxi. p. 178.

CHAPTER XVI.

Newton declines taking Orders—His Rooms in Trinity College—John Wickins his chamber-fellow—Letter from Mr. Nicolas Wickins his Son—Dr. Humphrey Newton his Amanuensis from 1684-1689—His two Letters to Conduitt—Newton's Speculations on the Theory of the Earth—James II. attacks the Rights of the Charter-House, and sends an illegal Mandamus to the University of Cambridge—Newton one of the Delegates to resist this encroachment on its privileges—The Vice-Chancellor deposed—The object of the deputation gained—Neglect of the Scottish Universities—Newton elected Member for Cambridge to the Convention Parliament—His habits of business—His Letters to Dr. Covel—His acquaintance with Locke—His Theological inquiries—Locke exerts himself to procure for him some permanent appointment in King's College, the Charter-House, and the Mint—Failure of that attempt—Newton's dis-appointment—Ingratitude of his Country—Death of his Mother at Stamford—Writes an account of Fluxions and Fluents for Wallis—His Letter to Locke on multiplying Gold—Boyle's recipes and belief in Alchemy.

IN the early chapters of this work we have brought down the personal history of Newton to the year 1675, when he was permitted by the Crown to retain the Lucasian Chair without going into orders. At a future period of his life, he was urged by some of the highest dignitaries in the Church to enter its pale, but feeling that his opinions were not in accordance with its Articles, he invariably declined, assigning as a reason that he could do more good to religion as a layman.

During the first twenty years of his residence at Cambridge, from 1667 to 1687, when the *Principia* was published, he was wholly occupied with those profound researches, of which we have given a full account, and tradition has preserved but a few anecdotes of a life so quiet and unvaried. Having out-lived almost all his companions at school and at college, it became difficult, even at the time of his death, to obtain authentic materials for an account of his early and middle

life, and his successors in Trinity College have therefore not been able to discover the locality of his early apartments. The chamber which was allotted to him as a Fellow in October 1667, was called the "Spiritual Chamber," which Mr. Edleston conjectures may have been "the ground room next the chapel in the north-east corner of the great court," but, as he adds, "it does not follow that he actually dwelt there," as it might have been occupied by a tenant. The rooms in which Newton lived from the year 1682 till he left Cambridge, are in the north-east corner of the great court. They are on the first floor of the staircase, on the right hand, or to the north of the gateway or principal entrance to the College, the outward door fronting the staircase, and the rooms being to the right.¹ His laboratory, as Dr. Humphrey Newton tells us, was "on the left end of the garden, near the east end of the chapel," and his telescope, which, according to the same authority, was five feet long,² was placed at the head of the stairs going down into the garden looking towards the east.³ The east side of Newton's rooms has been altered within the last fifty years. The wooden room, which projects into the garden, as seen in Loggan's engraving, is supported on pillars forming an arcade, and Professor Sedgwick, who came up to college in 1804, recollects it in that state. The arcade is now replaced by a wooden wall and brick chimney. The drawing on the next page is a view of Newton's rooms copied from Loggan's Plate.

Mr. John Wickins, a Fellow of Trinity College, two years junior to Newton, was one of his earliest and most esteemed friends, a similar dislike to their disorderly companions having

¹ *Memorandum* sent to me by the late Rev. Mr. Turnor, and Edleston's *Correspondence*, &c., p. xlii.

² This must have been a refracting telescope.

³ In the *Memorandum* by the late Rev. Mr. Turnor above-mentioned, he says, "I have some recollection that Mr. Jones the tutor mentioned, in one of his lectures on optics, that the reflecting telescope belonging to Sir Isaac Newton was then lodged in the observatory over the gateway; and I am inclined to think that I once saw it, and that a sinder was affixed to it."

SIR ISAAC NEWTON'S ROOMS IN TRINITY COLLEGE.

induced them to live together so early as 1665. Wickins continued to be Newton's chamber-fellow till he left college, and on the 4th April 1684, he was presented to the living of Stoke Edith, near Monmouth, by Paul Foley, Esq., afterwards Speaker of the House of Commons.¹ While Wickins retained his Fellowship, Newton drew for him his dividends and chamber rent, and when Newton himself quitted Trinity College, he left to his friend the whole furniture of his chamber, with a wooden pint flagon, and other articles, which were preserved in his family so recently as 1802.² Nicolas Wickins, the son of John, succeeded to the living at Stoke Edith; and having been requested by Professor Smith of Trinity College to furnish him with some particulars of Newton's college life, he addressed to him the following interesting letter :³—

“STOKE EDITH, Jan. 16th, 1727-8.

“DEAR SIR,—It was an unspeakable pleasure to me to see the hand of my old acquaintance; and I wish, in return, I could send something considerable to give you a pleasure relating to the great man you write about, but I am so unhappy as to find very little under Sir Isaac's own hand of what passed between him and my father.

“I guess from a small book I found among my father's papers, that he had a design to collect into one all that he had of Sir Isaac's writing, but he went no farther than transcribing three short letters he received from him, and a Common Place of his, part of which I find under Sir Isaac's own hand; the rest, with the original of these three letters, is lost. Besides these transcribed letters and the Common Place, I can meet with nothing but four or five letters under Sir Isaac's own

¹ Turner's *Newtoniana*, in the possession of the Royal Society.

² Wickins (Ds. Wickins), to whom Newton had frequently lent money, as we have stated in vol. i. p. 28, note, died on the 19th April 1719. See *Gentleman's Magazine*, April 1802.

³ We have given this and the two following letters verbatim, as possessing a higher degree of interest than any abstract of them that could be made.

hand, very short, and relating to dividends and chamber rent, which he was so kind as to receive for my father when at Monmouth, where he was most part of the time he continued Fellow. There being so little in these letters, I do not now send them, but wait for your commands ; for whatever I can meet with of this worthy man, shall be at your service.

“ My father’s intimacy with him came by mere accident. My father’s first chamber-fellow being very disagreeable to him, he retired one day into the walks, where he found Mr. Newton solitary and dejected. Upon entering into discourse, they found their cause of retirement the same, and thereupon agreed to shake off their present disorderly companions and chum together, which they did as soon as conveniently they could, and so continued as long as my father staid at college.

“ I have heard my father often say that he has been a witness of what the world has so often heard of Sir Isaac’s forgetfulness of his food when intent upon his studies ; and of his rising in a pleasant manner with the satisfaction of having found out some proposition without any concern for a seeming want of his night’s sleep, which he was sensible he had lost thereby.

“ He was turning grey, I think, at thirty, and when my father observed that to him as the effect of his deep attention of mind, he would jest with the experiments he made so often with quicksilver, as if from hence he took so soon that colour.

“ He sometimes suspected himself to be inclining to a consumption, and the medicine he made use of was the Leucatello’s Balsam,¹ which, when he had composed himself, he would now

¹ The following method of making the Leucatello’s Balsam I have found in Sir Isaac’s own hand : “ Put Venus turpentine one pound into a pint of the best damask rose-water ; beat these together till it look white, then take four ounces of bees-wax, red sanders half an ounce, oil of olives of the best a pint, one ounce of oil of St. John’s wort, and half a pint of sack. Set it (the sack) on the fire on a new pipkin, add to it the oil and wax, let it stand on a soft fire where it must not boil, but melt till it be scalding hot. Then take it off. When it is cold, take out the cake, and scrape off the dirt from the bottom. Take out the sack, wipe the pipkin, put in the cake again, set it on the fire, let them melt together, and then put in also the turpentine and sanders ; let them not

and then melt in quantity about a quarter of a pint, and so drink it.

“ It is now eight years since my father’s death, in which time many things my father used to relate of him are slipped out of my memory ; but being mostly of such a nature as I have now mentioned, I suspect would be of no service could I recollect any more.

“ But there is one thing, upon account of which not only my father, but myself also, shall always pay a peculiar regard to his memory, which was a charitable benefaction which has privately passed from him through my father’s, and since his death through my own hands. We have been the dispensers of many dozens of Bibles sent by him for poor people, and I have now many by me sent from him for the same purpose, which, as it shows the great regard he had for religion, I cannot but desire that by you it may be made public to the world.

“ Dear Sir, my thoughts dwell with wonderful delight upon the memory of this great and good man, and therefore I have troubled you with so long a letter, which I now beg pardon for, and in hope of again hearing soon from you, conclude with my brother’s hearty service and respects to you. I beg my humble service to all my old acquaintance, and am,

“ Dear Sir, your much obliged humble servant,

“ NIC. WICKINS.

“ To Mr. Professor SMITH, at
Trinity College, Cambridge.”

boil, but be well melted and mixed together ; take it off and stir it now and then till it is cold. If you would have it to take inwardly, add to it when it is off from the fire, half an ounce of powder of seuchineal (cochineal) and a little natural balsam.

“ For the measles, plague, or small-pox, a half an ounce in a little broth, take it warm, and sweat after it. And against poison and the biting of a mad dog ; for the last you must dip lint and lay it upon the wound, besides taking it inwardly. There are other virtues of it ; for wind, cholick, anoint the stomach, and so for bruises.”

Mrs. Vincent told Dr. Stukely that Sir Isaac was a great *Simpler*. The Doctor says that “ his breakfast was orange-peel boiled in water, which he drank as tea, sweetened with sugar, and with bread and butter. He thinks this dissolves phlegm.” Lord Pembroke told the Doctor that when Newton “ got a cold, he lay in bed till it was gone, though for two or three days’ continuance, and thus came off the illness by perspiration.”

In the year 1683, Newton requested Mr. Walker, who was then schoolmaster at Grantham, to engage Mr. Humphrey Newton of that town as an assistant and amanuensis. Mr. Newton willingly accepted of the offer, and remained with Sir Isaac nearly five years, from the end of 1683 to 1689, that interesting period during which the *Principia* was written and published. When Mr. Conduitt was in search of materials for the life of his relative, he naturally applied to Dr. Newton for information, and he obtained from him the two following letters, which throw much light on the "life and actions" of the great philosopher :—

"SIR,—Receiving yours, I return as perfect and faithful an account of my deceased friend's transactions, as possibly does at this time occur to my memory. Had I had the least thought of gratifying after this manner Sir Isaac's friends, I should have taken a much stricter view of his life and actions.

"In the last year of King Charles II., Sir Isaac was pleased, through the mediation of Mr. Walker (then schoolmaster at Grantham), to send for me up to Cambridge, of whom I had the opportunity, as well as honour, to wait of for about five years.¹ In such time he wrote his *Principia Mathematica*, which stupendous work, by his order, I copied out before it went to the press. After the printing, Sir Isaac was pleased to send me with several of them in presents to some of the heads of Colleges, and others of his acquaintance, some of which (particularly Dr. Babington of Trinity) said that they might study seven years before they understood anything of it. His carriage then was very meek, sedate, and humble, never seemingly angry, of profound thought, his countenance mild, pleasant, and comely. I cannot say I ever saw him laugh but once, which was at that passage which Dr. Stukely mentioned in his letter to your

¹ Dr. Stukely says, that "Mr. Newton of this town was five years under Sir Isaac's tuition at Cambridge."

honour,¹ which put me in mind of the Ephesian philosopher, who laughed only once in his lifetime, to see an ass eating thistles when plenty of grass was by. He always kept close to his studies, very rarely went a visiting, and had as few visitors, excepting two or three persons, Mr. Ellis,² Mr. Laughton of Trinity,³ and Mr. Vigani,⁴ a chemist, in whose company he took much delight and pleasure at an evening when he came to wait upon him. I never knew him to take any recreation or pastime either in riding out to take the air, walking, bowling, or any other exercise whatever, thinking all hours lost that was not spent in his studies, to which he kept so close that he seldom left his chamber except at term time, when he read in the schools as being Lucasianus Professor, where so few went to hear him, and fewer that understood him, that oftentimes he did in a manner, for want of hearers, read to the walls. Foreigners he received with a great deal of freedom, candour, and respect. When invited to a treat, which was very seldom, he used to return it very handsomely, and with much satisfaction to himself. So intent, so serious upon his studies, that he ate very sparingly, nay, oftentimes he has forgot to eat at all, so that, going into his chamber, I have found his mess untouched, of

¹ The passage alluded to in Dr. Stukely's letter was the following:—When Sir Isaac once laughed, " 'twas upon occasion of asking a friend, to whom he had lent Euclid to read, what progress he had made in that author, and how he liked him? He answered by desiring to know what use and benefit in life that study would be to him. Upon which Sir Isaac was very merry."—Stukely's *Letter to Dr. Mead*.

² Afterwards Sir John Ellis, Master of Caius.

³ Sir Charles Montague's letter to Newton in Chapter xix., and Monk's *Life of Bentley*, pp. 224, 226, 346, 360.

⁴ John Francis Vigani, a native of Verona, after having taught chemistry at Cambridge for twenty years, was invested by the University with the title of Professor of Chemistry. Dr. Bentley fitted up for him in Trinity College an old lumber house, as an elegant chemical laboratory, in which he lectured for some years.—Monk's *Life of Bentley*, p. 159. His lectures still exist in manuscript in the University library.

Among the anecdotes collected by Conduitt, I find the following relative to this chemist. It is signed C. C. (Catherine Conduitt), Sir Isaac's niece. "Upon Vigani's (with whom he was very intimate, and took great pleasure in discoursing with him on chemistry) telling him a loose story about a nun, he broke off all acquaintance with him."—C. C.

which, when I have reminded him, he would reply,—‘ Have I !’ and then making to the table, would eat a bit or two standing, for I cannot say I ever saw him sit at table by himself.¹ At some seldom entertainments, the Masters of Colleges were chiefly his guests. He very rarely went to bed till *two* or *three* of the clock,² sometimes not till *five* or *six*, lying about *four* or *five* hours, especially at spring and fall of the leaf, at which times he used to employ about six weeks in his laboratory, the fire scarcely going out either night or day, he sitting up one night and I another, till he had finished his chemical experiments, in the performances of which he was the most accurate, strict, exact. What his aim might be I was not able to penetrate into, but his pains, his diligence at these set times made me think he aimed at something beyond the reach of human art and industry. I cannot say I ever saw him drink either wine, ale, or beer, excepting at meals, and then but very sparingly. He very rarely went to dine in the hall, except on some public days, and then if he has not been minded, would go very carelessly, with shoes down at heels, stockings untied, surplice on, and his head scarcely combed.

“ As for his *Optics* being burned, I knew nothing of it but as I had heard from others, that accident happening before he writ his *Principia*.³ He was very curious in his garden, which

¹ Dr. Stukely mentions some other anecdotes of Newton’s absence:—“ When he had friends to entertain, if he went into his study to fetch a bottle of wine, there was danger of his forgetting them. He would sometimes put on his surplice to go to St. Mary’s church.” When he was “ going home to Colsterworth from Grantham, he once led his horse up Spittlegate Hill, at the town-end. When he designed to remount, his horse had slipped the bridle and gone away without his perceiving it, and he had only the bridle in his hand all the while.”—*Letter to Conduitt*.

“ Newton formerly would go the length of a street before he came to himself and saw that he was not dressed, and therefore had to hasten back to his house quite ashamed.” Krausen’s *Umständliche Bücher Historie*, part i. p. 2. Leipsic, 1715.—

² Dr. Stukeley informs us, “ that he heard him say, that during the course of his most intense studies, he learned to go to bed at twelve, finding, by experience, that if he exceeded that hour but a little, it did him more harm in his health than a whole day’s study.”

³ Dr. Stukely says, that “ he wrote a piece of chemistry, explaining the principles of

was never out of order in which he would at some seldome time take a short walk or two, not enduring to see a weed in it. On the left end of the garden was his elaboratory, near the east end of the chapel, where he at these set times employed himself in with a great deal of satisfaction and delight. Nothing extraordinary, as I can remember, happened in making his experiments ; which, if there did, he was of so sedate and even temper, that I could not in the least discover it. He very seldom went to the chapel, that being the time he chiefly took his repose ; and, as for the afternoon, his earnest and indefatigable studies retained him, so that he scarcely knew the house of prayer. Very frequently, on Sundays, he went to St. Mary's church, especially in the forenoon. I knew nothing, of the writings¹ which your honour sent, only that it is his own hand, I am very certain of, believing he might write them at some leisure hours, before he set upon his more serious and weighty matters. Sir Isaac at that time had no pupils nor any chamber-fellow, for that, I would presume to think, would not have been agreeable to his studies. He was only once disordered with pains at the stomach, which confined him for some days to his bed, which he bore with a great deal of patience and magnanimity, seemingly indifferent either to live or die. He seeing me much concerned at his illness, bid me not trouble myself ; ' For if,' said he, ' I die, I shall leave you an estate,' which he then mentioned.

" Sir, this is what I can at present recollect, hoping it may in some measure satisfy your queries.

that mysterious art upon experimental and mathematical proof, and he valued it much ; but it was unluckily burned in his laboratory, which casually took fire. He would never undertake that work again,—a loss much to be regretted. Mr. Newton, of this town, tells me likewise, that several sheets of his *Optics* were burnt by a candle left in his room, but I suppose he could recover them again." Dr. Newton, as we see above, gives this only as a report.

¹ I have not been able to discover what writings are here alluded to. They may have been his theological writings, such as his *Irenicum*, or, " Doctrines tending to Peace," which will be afterwards noticed.

“ My wife at this time is brought to bed of a son, whom I intend to nominate after my dear deceased friend. Would you please to honour me so far as to substitute Dr. Stewkely to stand as witness. I should take it as a very singular favour, and would very much oblige, Sir, your most humble and obedient servant,

“ HUMPHREY NEWTON.

“ GRANTHAM, *January 17, —2 $\frac{1}{2}$.”*

After trying, for a month nearly, to recollect some other particulars respecting Newton, which he had been requested to do by Mr. Conduitt, he addressed to him the following letter :—

“ SIR,—I return y^r honour a great many thanks for y^e favour you have done me in deputing Dr. Stewkely to stand in y^r stead as witness to my son. It is out of my sphere to make any grateful return, therefore doubt not but y^r goodness will in that point excuse my deficiency. I have bethought myself about Sir Isaac’s life as much as possibly I can. About 6 weeks at spring, and 6 at y^e fall, y^e fire in the elaboratory scarcely went out, which was well furnished with chymical materials as bodyes, receivers, heads, crucibles, &c., which was made very little use of, y^e crucibles excepted, in which he fused his metals ; he would sometimes, tho’ but very seldom, look into an old mouldy book w^{ch} lay in his elaboratory, I think it was titled *Agricola de Metallis*, the transmuting of metals being his chief design, for which purpose antimony was a great ingredient. Near his elaboratory was his garden, w^{ch} was kept in order by a gardiner. I scarcely ever saw him do anything as pruning, &c. at it himself. When he has sometimes taken a turn or two has made a sudden stand, turn’d himself about, ran up y^e stairs like another Archimedes, with an εὐρηκα, fall to write on his desk standing, without giving himself the leisure to draw a chair to sit down on. At some seldom times when he designed to

dine in y^e hall, would turn to the left hand and go out into the street, when making a stop when he found his mistake, would hastily turn back, and then sometimes instead of going into y^e hall, would return to his chamber again. When he read in y^e schools he usually staid about half an hour, when he had no auditors, he commonly returned in a 4th part of that time or less. Mr. Laughton who was then y^e library keeper of Trin. Coll. resorted much to his chamber; if he commenced Dr. afterwards I know not. His telescope, w^{ch} was at that time, as near as I could guess, was near 5 foot long, w^{ch} he placed at y^e head of y^e stairs going down into y^e garden, buting towards y^e east. What observations he might make I know not, but several of his observations about comets and y^e planets may be found scattered here and there in a book intituled *The Elements of Astronomy*, by Dr. David Gregory. He would with great acuteness answer a question, but would very seldom start one. Dr. Boerhaave (I think it is) Prof. Lips, in some of his writings, speaking of Sir Is. : That man, says he, comprehends as much as all mankind besides. In his chamber he walked so very much y^t you might have thought him to be educated at Athens among y^e Aristotelian sect. His brick furnaces, *pro re nata*, he made and altered himself without troubling a bricklayer. He very seldom sat by the fire in his chamber excepting y^t long frosty winter,¹ which made him creep to it against his will. I can't say I ever saw him wear a night gown, but his wearing clothes that he put off at night, at night do I say, yea rather towards y^e morning, he put on again at his rising. He never slept in y^e daytime y^t I ever perceived; I believe he grudged y^e short time he spent in eating and sleeping. Ἀνέχου καὶ ἀπέχου may well and truly be said of him, he always thinking with Bishop Saunderson, temperance to be the best physick. In a morning he seemed to be as much refreshed with his few hours' sleep as though he had taken a whole night's rest. He kept neither

¹ This was the famous frost of 1683-4, which began early in December, and continued without intermission till the 5th of February.

dog nor cat in his chamber, wh^{ch} made well for y^e old woman his bedmaker, she faring much y^e better for it, for in a morning she has sometimes found both dinner and supper scarcely tasted of, w^{ch} y^e old woman has very pleasantly and mumpingly gone away with. As for his private prayers I can say nothing of them ; I am apt to believe his intense studies deprived him of y^e better part. His behaviour was mild and meek, without anger, peevishness, or passion, so free from that, that you might take him for a stoick. I have seen a smal past-board box in his study set against y^e open window, no less as one might suppose than a 1000 guin. in it crowded edgeways, whether this was suspicion or carelessness I cannot say ; perhaps to try the fidelity of those about him. In winter time he was a lover of apples, and sometimes at a night would eat a small roasted quince. His thoughts were his books ; tho' he had a large study seldom consulted with them. When he was about 30 years of age his grey hairs was very comely, and his smiling countenance made him so much y^e more graceful. He was very charitable, few went empty handed from him. Mr. Pilkinton, who lived at Market Overton, died in a mean condition (though formerly he had a plentiful estate), whose widow with 5 or 6 children Sir Is. maintained several years together. He commonly gave his poor relations (for no family so rich but there is some poor among them), when they apply'd themselves to him, no less than 5 guineas, as they themselves have told me. He has given the porters many a shilling not for leting him (in ?) at y^e gates at unreasonable hours, for that he abhorred, never knowing him out of his chamber at such times. No way litigious, not given to law or vexatious suits, taking patience to be y^e best law, and a good conscience y^e best divinity. Says Seneca, somebody will demonstrate which way comets wander, why they go so far from y^e rest of y^e celestial bodies, how big, and what sort of bodies they are, w^{ch} had he been contempory with Sir Is. he might have seen this prophecy of his fulfilled by y^e wonder of his age. Could y^r Hon^r pick somethings out of

this indigested mass worthy to be inserted into y^e life of so great, so good, and so illustrious a person as Sir Isaac Newton ! it would be of infinite satisfaction to him, Sir, who is y^r Hon^r's most humb. and most obedient serv^t,

H. NEWTON.

“ Feb. 14, 172 $\frac{1}{2}$, GRANTHAM.”

After Newton had completed his optical researches, and brought to a close his controversy with the Dutch philosophers, he was called upon to direct his attention to a less congenial subject. His friend, Dr. Thomas Burnet, who had been Senior Proctor when Newton took his degree in 1668, and who, as we shall presently see, set him the noble example of resisting arbitrary power, had printed, in 1680, his *Theoria Telluris Sacra*,¹ an eloquent physico-theological romance, which not only received the warm approbation of the King, but was applauded by the poets, and, to a certain extent, adopted even by Newton. Abandoning, as some of the fathers had done, the hexameron, or six days of Moses, as a physical reality, and having no knowledge of geological phenomena, he gives loose reins to his imagination, combining passages of Scripture with those of ancient authors, and presumptuously describing the future catastrophes to which the earth is to be exposed. Previous to its publication, Burnet presented a copy of his book to Newton, and requested his opinion of the theory which it expounded. In a letter dated 24th December 1680, Newton sent him “some exceptions to particular passages,” which elicited explanations from their author, and led him to propose new questions of a theological as well as of a scientific nature. To this letter of Burnet's, which was of great length, and dated January

¹ “The Sacred Theory of the Earth, containing an account of the original of the Earth, and of all the general changes which it hath already undergone, or is to undergo, till the consummation of all things.” The Latin edition was published in 4to in 1681, and at the King's request, it was translated into English, the first part, in folio, appearing in 1684, and the second in 1689.

13, 1680-81, Newton replied in one nearly as long,¹ and possessing a very considerable degree of interest. He treats of the formation of the earth, and the other planets, out of a general chaos,—of the figure assumed by the earth,—of the length of the primitive days,—of the formation of hills and seas,—and of the creation of the two ruling lights as the result of the clearing up of the atmosphere. He considers the account of the creation in Genesis as adapted to the judgment of the vulgar. “Had Moses,” he says, “described the processes of creation as distinctly as they were in themselves, he would have made the narrative tedious and confused amongst the vulgar, and become a philosopher more than a prophet.” After referring to several “causes of meteors, such as the breaking out of vapours from below, before the earth was well hardened, the settling and shrinking of the whole globe after the upper regions or surface began to be hard,” Newton closes his letter with an apology for its being tedious, which, he says, “he has the more reason to do, as he has not set down any thing he has well considered, or will undertake to defend.”²

The primitive condition of the earth, and its preparation for man, was a subject of general speculation at the close of the seventeenth century. Leibnitz, like his great rival, attempted to explain the formation of the earth, and of the different substances which composed it; and he had the advantage of possessing some knowledge of geological phenomena. The earth he regarded as having been originally a burning mass, whose temperature gradually diminished till the vapours were condensed into a universal ocean which covered the highest mountains, and gradually flowed into vacuities and subterranean cavities, produced by the consolidation of the earth’s crust. He regarded fossils as the real remains of plants and animals which

¹ The copy of this letter, which I have found along with the last of Burnet’s, among the Portsmouth papers, is in Newton’s own hand, but has no date or signature. The two first letters of the correspondence I have not met with.

² As this letter is very interesting, I have given it in the APPENDIX, No. IV.

had been buried in the strata ; and, in speculating on the formation of mineral substances, he speaks of crystals as the geometry of inanimate nature.¹

While Newton was thus speculating on geology, we find him in communication with Flamsteed, through their mutual friend, Mr. Crompton of Cambridge, on the subject of the comet of 1680, and, in so far as we are informed by the two letters of Newton, published in the General Dictionary, we have, in a preceding chapter,² given an account of the object and results of their correspondence. Since that chapter was printed, however, we have obtained the originals and draughts of these letters, and of other three, which passed between Newton and Flamsteed on the same subject.³ In an unpublished memorandum, dated the Observatory, December 15, 1680, Flamsteed mentions that he had not seen the comet before sunrise in November, but that it was seen by Cuthbert ; and that by what he learned from others, he concluded, that having passed the sun, it would appear in December after sunset. He accordingly discovered it on the Friday before the 11th of December ; and, in another memorandum, dated January 3d, he sends to his correspondent (Crompton probably) the observation he has made. He tells him that the tail, which was 35° long, is a little curved and best defined on the left hand, and he asks his opinion on a conjecture, that the comet may be “ a consuming substance, much decayed, and the fuel spent which nourished its blaze.” In the first of these unpublished letters addressed

¹ These views of Leibnitz are contained in his *Protogæa*, an Essay which he published in the Leipsic Journal for 1683. It was published separately at Göttingen by Scheidius in 1749. See the *Acta Eruditorum*, 1717.

² See vol. i. chap. xii. p. 263. One of these letters is addressed to Crompton, and the other to Flamsteed. This last letter is dated 1680 in place of 1681, in the *General Dictionary*, vol. vii. p. 791.

³ I find among these papers a table showing the R. ascension, declination, and culmination of the comet, from December 16, 1680, to February 1, 1681, as made in Maryland, America, in west longitude 75° , and north latitude $38^{\circ} 30'$, by Mr. Arthur Storer, a nephew of Dr. Babington, at the river Patuxant, near Hunting Creek. See Newton's *Opera*, tom. iii. p. 145 ; *Principia*, lib. iii. prop. xli.

to Crompton,¹ Flamsteed transmits, for Newton's information, the observations made by Gallet at Rome, which Cassini had sent to Halley, others made at Rome by Maria Antonio Cellio, sent also by Halley from Paris, and an observation made at Canterbury by one Hill,² an artificer, with an instrument four feet radius ; and, from a comparison of these, he proves, in opposition to the opinions of Newton and Cassini, that there were not two comets.³ We have already seen⁴ that Newton at one time believed that comets moved in straight lines. This opinion seems to have been adopted from Flamsteed, who says, in the continuation of his letter, "By this indented figure Mr. Newton will see that the comet ran up towards the sun nearly in a straight line, and returned from him in a like one, for the places of these lines, however altered, will not remove far from where I have designed them, except he will suppose the acceleration of its motion in its progress, and retardation in its return, to be much different from what I have made it, which also I am apt to think he will find not likely." He then proceeds to give the following views respecting comets, and the structure of the sun :—

"Hence it should seem that the comet was attracted and repelled by the sun, as I imagined and proposed in my last letter. Mr. Newton brings an experiment of a red-hot magnet not attracting iron, or a cold magnet, or red-hot iron, against which I have this to assume, that the attraction of the sun may be of a different nature, and that I even suppose the sun to be not like a mass of red-hot iron, but a *solid globe of gross matter*, encompassed with a spirituous liquid, which, by its violent motion, striking the particles of the air, causes the heat we

¹ March 7, 1681.

² I found half of Hill's letter to Flamsteed, dated Canterbury, Dec. 29, 1681, containing observations on the comet in November 11, 1680, and January 3, and February 3, 1681.

³ Newton afterwards acknowledged, in the *Principia*, the correctness of Flamsteed's opinion.

⁴ See vol. i. p. 264, note 2.

feel from him sometimes so intolerable ; for, if I remember right, I have read in the journals of travellers, that when they have travelled over high mountains in hot countries, they have found the heat far less than in the valleys, and that *the substance of the sun is terrestrial matter, his light but liquid menstruum encompassing him*, the phenomena of the spots I think will prove. Admit this, and it will still follow that he may attract the comet and swell it, as the observations evidence he did. Mr. Halley thinks the comet to be a body that has lost its principle of gravitation, and yet I perceive would have it attracted by the sun, which I cannot assent to, for then I see no reason why its mass should not dissipate, and the atoms composing it separate themselves and scatter over the wide æther."

In the conclusion of this long letter, Flamsteed answers very fully the queries of Newton respecting the state through which the tail of the comet passed every day, and the alterations he observed in its head ; and he sends him the observations made by Cellio, and by himself at Greenwich, from Dec. 12, 1680, to Feb. 5, 1681.

In Newton's *published* reply to this letter,¹ he endeavours to reconcile the various observations with his idea of two comets, and transmits some of his own, made with a three-feet perspective, having a great magnifying power ; but he takes no notice whatever of Flamsteed's speculations on the sun, and on the action of heated magnets. I found, however, the original scroll of the letter, which is quite different from the one actually sent, and which contains, on a separate sheet, a long discussion of Flamsteed's hypothesis, which possesses considerable interest.² The other letters of Flamsteed were addressed to Newton while he was writing and printing the *Principia*, and contain many instructive details. They complete the in-

¹ April 16, 1681. *General Dictionary*, vol. vii. p. 791.

² This portion of the letter seems to have been intended to be sent to Flamsteed through Crompton. See APPENDIX, No. V.

teresting correspondence, a part of which had been long ago published in the General Dictionary.¹

When Newton was engaged in writing the second and third book of the *Principia*, an event occurred at Cambridge which drew him from his seclusion, and placed him in a noble position on the theatre of public life. Desirous of re-establishing the Catholic religion in its former supremacy, James II. had begun to tamper with the rights and privileges of his Protestant subjects, and to sap the foundations of the Established Church. He had in 1686, and in open violation of the laws, conferred the Deanery of Christchurch, an office of the highest dignity in Oxford, upon John Massey, a person who had no other qualification than that of being a member of the Church of Rome ; and boasting of this exercise of power, he told the Pope's nuncio, that " what he had done at Oxford would very soon be done at Cambridge."

Before making this attempt, however, he tried his apprentice hand upon an inferior institution, which was more likely to comply with a royal demand. He sent a *mandamus* to the Masters and Governors of the Charterhouse, requiring them to admit as a pensioner into the hospital under their care, an old Catholic gentleman of the name of Popham. The Board of Governors, before whom this mandate was laid, consisted of the Lord Chancellor Jeffrys, the Archbishop of Canterbury, the Bishop of Winchester, the Earl of Danby, the Earl of Rochester, the Earl of Mulgrave, and Mr. Thomas Burnet, the Master. By the rule of election, in giving their votes, the Master, as the humblest of the electors, speaks first. In the exercise of this privilege, Mr. Burnet, a clergyman of high character, stated to the Board, that the mandate to elect a Catholic was contrary

¹ All the published letters, except one, are from Newton to Flamsteed ; and this one from Flamsteed to Newton, dated Sept. 25, 1685, is very different from the one published, which must have been printed from a scroll, and greatly altered by Flamsteed. The unpublished letters, six in number, were written between December 1684 and October 1686.

both to the will of the founder and an Act of Parliament. "What is that to the purpose?" said one of the Governors. "It is very much to the purpose, I think," replied a voice feeble with age,¹ "an Act of Parliament is, in my judgment, no light thing." A vote was then taken, which stood thus;—

AGAINST THE MANDATE.
 Thomas Burnet, Master.
 Archbishop of Canterbury.
 Bishop of Winchester.
 Earl of Danby.

FOR THE MANDATE.
 Chancellor Jeffrys.
 Earl of Rochester.
 Earl of Mulgrave.

On the rejection of the royal candidate, Jeffrys decamped in a rage, and being followed by others of the minority, a quorum was not left to make a formal reply to the royal mandate.²

This defeat of the king might have induced him to pause in his threatened attack upon the University of Cambridge. He had supposed, however, that the heads of colleges, and the other members of the senate, would submit more readily to his power than the Peers and Bishops who governed the Charterhouse, and he accordingly issued a mandate in February 1687, directing that Father Alban Francis, a Benedictine monk, should be admitted a Master of Arts without taking the oaths of allegiance and supremacy. Upon receiving the mandamus, Dr. Pechel, Master of Magdalen College, who was then Vice-chancellor, sent a messenger to the Duke of Albemarle the Chancellor, to request him to get the mandamus recalled; and the registry and bedells waited upon Francis to offer him instant admission, if he took the necessary oaths. The king and the monk were equally inexorable. The Chancellor was received coldly and ungraciously; and Francis, after refusing to subscribe the oaths, took horse and hastened to the palace to make known his disappointment.

¹ Mr. Macaulay says, and no doubt on good authority, that this was the venerable Duke of Ormond. I have followed, in the list of governors present, a manuscript account of the meeting, which was sent to Sir Isaac Newton, and which contains the names of those who voted for and against the mandate.

² See Macaulay's *Hist. of England*, vol. ii. pp. 293, 294.

Thus placed in open collision, the Court and the University used every means to support their cause. The royal commands had hitherto been obeyed ; and when foreign princes or their ambassadors visited the Universities, the honour of a degree was invariably conferred upon them : Even the ambassador of the Emperor of Morocco, though a Mahometan, had received this distinction. On the part of the University the difference between honorary degrees to foreigners, and ordinary degrees to residents, was strongly urged. As every Master of Arts has a vote in the Senate, a majority in that court might be obtained by the admission of Catholic priests, and the Protestant character of the University overturned. Influenced by views like these, and fortified by charters and statutes, and by the best legal opinions, the Senate unanimously refused to obey the king. A menacing letter from Sunderland was despatched to shake the firmness of the University ; but though humble and respectful explanations were sent in reply, no hope of compliance was breathed, and no compromise proffered to the Crown. In consequence of these proceedings, the Vice-chancellor and deputies from the senate were summoned before the new High Commission at Westminster on the 21st of April.

The deputation appointed by the senate consisted of Mr. Newton, Mr. Stanhope, the Chancellor of Ely, and other six deputies ; but before they went to London, they held a previous meeting, in order to prepare their explanations and defence for the Court. "Some feeble or false men," as Burnet calls them, "had proposed to grant the degree on the condition that it should not be drawn into a precedent, and this contemptible proposal had recommended itself to the Chancellor of Ely." He accordingly produced a paper, which he hoped the other deputies would sign, and in which this measure was presented in the most plausible form. A disposition to approve of it was manifested by the other deputies ; but Newton seeing the character of the compromise, rose from his chair, took two or three turns round the room, and addressing the University bedell,

then standing at the fire, said to him, "This is giving up the question." "So it is," replied the bedell, "why didn't you go and speak to it?" Upon which Newton went to the table, expressed his opinion, and proposed that the paper should be shown to counsel. This suggestion was adopted. The paper was submitted "to Mr. Finch, afterwards solicitor to Lord Guernsey," and when he had given the same opinion as Newton, the Chancellor of Ely and the rest of the deputies concurred.¹

On the 21st of April the Council-chamber was filled with a large assemblage. Jeffrys presided at the board, and the Earl of Mulgrave, the sceptic and the hypocrite sat there, a worthy companion to the judge. The members of the deputation appeared as a matter of form before the Commissioners, and were dismissed. On the 27th of April they gave in their plea. On the 7th of May it was discussed and feebly defended by their incompetent Vice-chancellor. The deputies maintained, that in the late reign several royal mandates had been withdrawn, and that no degree had ever been conferred without the oaths of supremacy and obedience being taken. Jeffrys let loose his insolence against the timid Vice-chancellor, silenced the other deputies when they offered to speak, and without a hearing ordered them out of Court. When recalled the deputies were reprimanded. Pechel was deprived of his office as Vice-chancellor, and of his emoluments as Master of Magdalen College, and the following words closed the address of Jeffrys:—"Therefore I shall say to you what the Scripture says, and rather because most of you are divines, 'Go your way and sin no more, lest a worse thing come unto you.'"²

¹ This interesting anecdote I found in a manuscript of Mr. Conduitt, intended for insertion in his proposed Life of Newton.

² "The Chancellor Jeffrys," says Mr. Edleston, "alluded twice to his having himself formerly been a member of the University. Until some other College can establish a claim to him, Trinity College is liable to the suspicion of having had him for an *alumnus*. A 'Georgius Jeffreys' was admitted pensioner there March 15th, 1661-2, under Mr. Hill, and he would therefore be a year junior to Newton."—*Correspondence, &c.* p. viii. note 90.

Under this rebuke, and in front of such a judge, the vilest and most ferocious that ever sat upon the judgment-seat, stood the immortal author of the *Principia*, who had risen from the invention of its problems to defend the religion which he professed, and the University which he loved and adorned. The mandate which he resisted—a diploma to a monk—was in one sense an abuse of trivial magnitude, unworthy of the intellectual sacrifice which it occasioned ; but the spark is no measure of the conflagration which it kindles, and the arm of a Titan may be required to crush what the touch of an infant might have destroyed.

Deprived of their vice-chancellor, the University chose for his successor John Balderston, Master of Emanuel College, “a man of much spirit,” who promised to his constituents at his election, that while he held office neither religion nor the rights of the body should, through his means, be invaded.¹ Thus unanimously and nobly defended, Protestantism was now firmly established, the rights of the University protected, and the Court taught a lesson by which it had not the wisdom to profit.² The University of Oxford, however, drew instruction from the wisdom of its younger sister, and in the noble stand which, in the case of Magdalen College,³ she made against a similar abuse of power, she triumphed over the tyrant that assailed her, and contributed to his fall.

Under their Protestant constitution, the Universities of England have risen to a distinguished place among the literary and scientific institutions of Europe ; and though attempts have been recently made in Oxford to tamper with the national faith,

¹ See Burnet's *Hist. of his Times*, vol. ii. p. 697, or 8vo edit. vol. iii. p. 149.—Macaulay's *Hist. of England*, vol. ii. p. 180.

² Dr. Pechel was restored to his offices on the 24th of October 1688. “After the Revolution he starved himself to death, in consequence of having been rebuked by Archbishop Sancroft for drunkenness and other loose habits ; and after four days' abstinence, would have eaten, but could not.”—Note of Lord Dartmouth upon Burnet's *Hist.* vol. ii. p. 698, or vol. iii. 8vo, p. 150.

³ See Macaulay's *Hist. &c.* vol. ii. p. 287, &c.

we trust that the new system of government which Parliament has provided, will protect her youth against religious innovation, and obtain for them a course of instruction in which science as well as literature shall be taught.

In our Scottish Universities, once favoured by the Sovereign, and honoured by distinguished names, we would desire to see some approximation, in character and endowment, to our English Institutions. Although the Scottish Commissioners provided, in the Treaty of Union, for the maintenance of their Colleges, their endowments have been permitted to decay—their rights and privileges, protected by ancient charters, have been invaded by the Crown—incompetent Professors, the creatures of political subserviency, have, by royal and private patronage, been appointed to their most important chairs; and the sons of the nobility and gentry of the land have been driven to complete their education in the schools and universities of England.

From the precincts of the High Court of Commission, Newton returned to Trinity College to complete the *Principia*, and in the course of six weeks, in the month of June 1687, this great work was given to the public.¹

At the time when Flamsteed was supplying Newton with observations for the *Principia*, Halley was carrying on that interesting correspondence, of which we have published all the letters that had at that time been found.² I have been so fortunate, however, as to discover the letters of Halley which were wanting, and which add greatly to the value of the collection. The last of them possesses a peculiar interest, from being the one in which Halley announces to Newton the completion of the *Principia*, and gives him notice of the copies of the work which he despatched to Cambridge:—

¹ When the late Duke of Somerset, as his Grace informed me, visited the Marquis de Laplace at Arcueil, he found him in his study dressed in a sort of uniform, prepared to go to the Senate. Having in his hand the first edition of the *Principia*, he said to the Duke, "This is the best book that was ever written"

² See vol. i. p. 269, and APPENDIX, vol. i. No. VIII.

“LONDON, July 5, 1687.

“HONOURED SIR,—I have at length brought your book to an end, and hope it will please you. The last errata came just in time to be inserted. I will present from you the book you desire to the Royal Society, Mr. Boyle, Mr. Paget, Mr. Flamsteed, and if there be any else in town that you design to gratify that way; and I have sent you to bestow on your friends in the University 20 copies, which I entreat you to accept. In the same parcel you will receive 40 more, which having no acquaintance in Cambridge, I must entreat you to put into the hands of one or more of your ablest booksellers to dispose of them. I intend the price of them, bound in calves’ leather, and lettered, to be 9 shillings here. Those I send you I value in quires at 6 shillings, to take my money as they are sold, or at 5^{sh.} for ready, or else at some short time; for I am satisfied there is no dealing in books without interesting the booksellers; and I am contented to let them go halves with me, rather than have your excellent work smothered by their combinations. I hope you will not repent you of the pains you have taken in so laudable a piece, so much to your own and the nation’s credit, but rather, after you shall have a little diverted yourself with other studies, that you will resume those contemplations wherein you had so great success, and attempt the perfection of the lunar theory, which will be of prodigious use in navigation, as well as of profound and public speculation. Sir, I shall be glad to hear that you have received the books, and to know what farther presents you would wish in town, which shall be accordingly done. You will receive a box from me on Thursday next by the waggon, that starts from town to-morrow. I am your most obliged humble servant,

“EDM. HALLEY.

“To Mr. Isaac Newton,
In Trinity Colledg. Cambridg.—These.”

The active and influential part which Newton had taken in defending the privileges of the University, more than his high

scientific attainments, not yet sufficiently appreciated even at Cambridge, induced his friends to bring him forward as a candidate for a seat in the Convention Parliament. The other candidates were Sir Robert Sawyer and Mr. Finch. Newton was elected by a majority of five over Mr. Finch,¹ and he sat in Parliament from January 1689 till its dissolution in February 1690.

Thus launched into public life from the seclusion of a college, and residing in London away from his books and instruments, Newton abandoned for a time his scientific researches, devoting himself, when free from parliamentary duty, to theological studies, and looking forward to some higher station in the University, or some permanent appointment from the Government. As a member of the Legislature at an eventful epoch in the history of England, he conducted himself with firmness and moderation, maintaining the principles of civil and religious liberty,² and exhibiting a capacity for business which could scarcely have been expected from a philosopher who had mixed so little with society. During the thirteen months that he sat in the House of Commons, he seems to have taken no share in the debates or in the business of the House. On the 30th April 1689, he moved for leave to bring in a bill to settle the charters and privileges of the University of Cambridge, and Sir Thomas Clarges did the same for Oxford, yet neither of them seems to have made any speech on the occasion. But though a silent he was an active member, and it appears from his

¹ The votes stood thus :—

Sir Robert Sawyer,	125
Mr. Newton,	122
Mr. Finch,	117

In some of the voting papers he is called *præclarus vir*, and in others, *doctissimus, integerrimus, venerabilis et reverendus*.—Edleston's *Correspondence*, &c., p. lix.

² In referring to the publication of the *Principia*, Laplace remarks "that the principles of the social system were laid in the following year, and that Newton concurred in their establishment."—*Système du Monde*, p. 372. Edit. 1824.

letters to Dr. Covel,¹ the Vice-chancellor, that he had an onerous duty to perform to his constituents as well as to the Government. The friends of James were still numerous at Cambridge. Disturbances had broken out at the end of the year, and so "many scholars were in arms," that the Vice-chancellor was obliged to address the heads of Colleges on the subject. Considering the effect of these disturbances "as very dangerous to the University, as well as destructive to all good manners, he conceived that the best course to reduce them would be to convene the students in some place of the College next morning, if they returned, and gravely but calmly advise them to all civil behaviour, believing all severity at this juncture might rather tend to exasperate them more, and bring the unruly people's fury upon us all."²

Some of the members of the University, who had lately sworn allegiance to the exiled king, had some difficulty in vowing fidelity to his successor, and it required more sagacity to deal with conscientious scruples than with positive discontent. On the 12th of February, the day after King William and Queen Mary were proclaimed at Whitehall, Newton intimated to the Vice-chancellor that he would soon receive an order to proclaim them at Cambridge. He enclosed a form of the proclamation, and "heartily" expresses "the wish that the University would so compose themselves as to perform the solemnity with a reasonable decorum ; because I take it to be their interest to set the best face upon things they can, after the example of the London divines." He advises Dr. Covel to grant no degrees till he is authorized to administer the new oaths, and when they are administered, to administer them in English.

In replying to this letter, Dr. Covel seems to have suggested some arguments that might be employed to remove the scruples of "the dissatisfied part of the University," and in order that

¹ *Thirteen Letters from Sir Isaac Newton to Dr. Covel*, printed in 1848 by Dawson Turner, Esq., from the originals in his possession.

² *Thirteen Letters, &c.*, pp. 9, 10.

he might "have a fuller argument for convincing them," Newton sends him his views upon the subject, as "he cannot do the University better service than by removing the scruples of as many as have sense enough to be convinced with reason." He then lays down three propositions, the illustrations of which will be found in the letter itself, which we cannot withhold from the reader.¹ Faith and allegiance, he says, are due to the king by the law of the land, and were it "more than what the law requires, we should swear ourselves slaves, and the king absolute, whereas by the law we are freemen, notwithstanding these oaths." . . . "Allegiance and protection are always mutual, and therefore when King James ceased to protect us, we ceased to owe him allegiance by the law of the land. And when King William began to protect us, we began to owe him allegiance." . . . "If the dissatisfied party accuse the convention for making the Prince of Orange king, 'tis not my duty to judge those above me, and therefore I shall only say that if they have done ill, *Quod fieri non debuit, factum valet*. And those at Cambridge ought not to judge and censure their superiors, but to obey and honour them according to the law, and the doctrine of passive obedience."²

During his residence in London, Newton became acquainted early in 1689 with John Locke, whom he doubtless met at the weekly parties given by his friend Lord Pembroke, "for the purpose of conversation and discussion." Locke had taken a great interest, as we have already seen,³ in the sublime truths demonstrated in the *Principia*, and lived on the most affectionate terms with its author till the time of his own death. In

¹ See APPENDIX, No. VI. In the library of Queen's College, Oxford (cclxxxiv. fol. 143), there is a paper entitled "Reasons given for the taking the oaths of allegiance to King William, by I. N." This is doubtless an extract from Newton's letter to Covel.

² Newton appears not to have enjoyed good health during his residence in London. He was confined to his room for some days in the middle of March, and in May he was attacked by "a cold and bastard pleurisy." His address was "at Mr. More's house, in the broad century at the west end of Westminster Abbey."

³ See vol. i. p. 296.

the summer of the same year, Newton had the gratification of becoming personally acquainted with Christian Huygens, one of the most illustrious of his contemporaries. At the meeting of the Royal Society on the 12th of June, each of them addressed the members,—Huygens on the subject of gravity, of which he knew little compared with Newton, and Newton on the subject of the double refraction and polarisation of Iceland crystal, of which he knew little compared with Huygens.¹

We have already mentioned that Newton and his friends were looking out for some public situation worthy of his acceptance. While living in London he no doubt experienced the unsuitableness of his income to the new position in which he was placed. He had made nothing by his writings; and with a generous disposition, to which frequent appeals were made by some of his less wealthy relatives, he must have felt unselfishly the bitterness of poverty, nor was that feeling diminished by the consideration that his academical contemporaries, whom he had outstripped in talent, were occupying the highest positions in the Church or at the Bar, or basking in the more genial sunshine of official case.

The death of the Provost of King's College, Cambridge, gave his friends an opportunity, not wisely embraced, of showing their disposition to serve him. The King had issued a mandamus commanding the College to choose Mr. Upman, Fellow of Eton, but an outcry having been raised against him for having preached in favour of King James's Declaration of Indulgence, a new mandamus was issued in favour of Mr. Newton. The College, however, resisted his appointment, as it was required by the statutes that the Provost should be in priest's orders, and chosen from among the Fellows of the Society.² His appointment, therefore, would have been contrary to law; and when, on the 29th of August 1689, the case was heard before the King and Council, he was found to be disqualified for the

¹ See vol. I. p. 187.

² Cole's MSS., vol. xvi. folio 350.

office.¹ In consequence of this disappointment the friends of Newton were more solicitous to serve him. The Parliament was dissolved on the 6th of February, and at the new election Newton was not returned.

On his way to Cambridge, he had spent some time, along with Locke, at Sir Francis and Lady Masham's at Oates, and as he had then no occupation but that of the Lucasian Chair, a public provision for him must have been there a topic of discussion. Locke had interested in his favour Lord and Lady Monmouth, and in a letter to him, dated October 28, 1690, he requests Locke to thank them for their kind remembrance of him, and speaks of his obligations to them "whether their design succeeded or not." The office which they had in view was probably that of Comptroller of the Mint, for we find him in the following year thanking Locke "heartily for being so mindful of him, and ready to assist him with his interest," and asking him for the "scheme he has laid of managing the Comptroller's place of the Mint."²

In the same year an attempt was made to obtain for Newton the Mastership of the Charterhouse, but he disliked the project, and seems to have been inactive in the matter. Locke put him in mind of it, and drew from him the reply, "that he saw nothing in the situation worth making a bustle for. Besides a coach," he adds, "which I consider not, 'tis but £200 per annum, with a confinement to the London air, and to such a way of living as I am not in love with, neither do I think it advisable to enter into such a competition as that would be for a better place."³ After these repeated failures, he seems to have thought that his friends were inactive, if not insincere; and he does not scruple to tell Locke "that he is fully convinced that Mr. Montague, upon an old grudge which he thought had been worn out, was false to him, and that he had done with him, intending to sit still unless my Lord Monmouth

¹ Edleston's *Correspondence*, &c., p. lix. note 96.

² June 30th, 1691.

³ December 13, 1691.

was still his friend.”¹ Though assured by Locke, in reply, that Lord Monmouth was still his friend, he expressed his happiness at the intelligence, and stated in his answer² that “his inclinations were to sit still,” and that he intended not to give his Lordship and him any farther trouble.³

We do not envy the reader who peruses these simple details without a blush of shame for his country. That Locke, and Lord Monmouth, and Charles Montague, could not obtain an appointment for the author of the *Principia*, will hardly be believed in any country but our own. Had he been ambitious of honours, to which the philosophers of other lands have since his time attained, or had he aimed at those official positions to which merit has no claim in England, we might have felt a modified sympathy in his failure; but in aspiring only to the presidency of a college, to the mastership of a school, or to an inferior office in the Mint, and obtaining none of them, we participate in that depth of feeling which the language we have quoted so clearly indicates. The ingratitude of his country disturbed, as we shall see, the tranquillity of a mind sensitively organized, and intellectually overwrought. At the age of fifty, the high priest of science found himself the inmate of a college, and, but for the generous patronage of a friend, he would have died within its walls.

While Newton was discharging his duties in Parliament, he experienced a severe domestic affliction in the loss of his mother. The anxious and tender care with which she had watched over his helpless infancy, and reared to a vigorous manhood her only and sickly child, had produced, on his part, an attachment more than filial, while she had followed, with a mother's pride, the rising reputation of her son. In 1689, Benjamin Smith, the half-brother of Newton, had been seized,

¹ Jan. 26, 1691-2.

² Feb. 16, 1691-2.

³ In these letters, which are published in Lord King's *Life of Locke*, Edit. 1830, vol. i. pp. 400-411, there are interesting details about Newton's *Historical account of two notable corruptions of Scripture*, to which we shall return when we treat of his theological writings.

while at Stamford, with a malignant fever. His mother, who had hastened to attend his sick-bed, was taken ill with the same complaint, and Newton left his duties and his studies to watch at her couch. He sat up with her whole nights, administered with his own hands the necessary medicines, and prepared and dressed her blisters with all the dexterity of a practitioner. His skill, however, was unavailing. She sank under the disease, and her remains were carried to Colsterworth, and deposited in the north aisle of the church, where the family had generally been interred.

After the dissolution of the Convention Parliament, Newton had resumed his philosophical and mathematical studies. In July 1691, he drew up the directions to Dr. Bentley, to enable him to understand the *Principia*.¹ In introducing to Flamsteed Mr. David Gregory, whom he had recently recommended to the vacant chair of astronomy at Oxford, he mentions his anxiety to have his observations on Jupiter and Saturn for the next twelve or fifteen years, adding, "If you and I live not long enough, Mr. Gregory and Mr. Halley are young men;" and he expressed an anxiety to know "if in long telescopes the light of Jupiter's satellites, before they disappear, incline either to red or blue, or become more ruddy or more pale than before."² One of his occupations at this time was drawing up for Wallis his explanation of fluxions and fluents, in two problems, with illustrations, being the first account of the new calculus published by himself.³ Wallis had requested him to give an explanation of the two methods, namely, of finding fluxions and fluents, which he concealed in transposed letters in his epistle to Oldenburg; and it was in obedience to this request that he sent him his account of fluxions. While Wallis's volume was in the press, Leibnitz had addressed a letter⁴ to

¹ See vol. i. APPENDIX No. XI., p. 420.

² Baily's *Flamsteed*, p. 129.

³ Wallisii *Opera*, vol. ii. pp. 391-396. This communication was contained in two letters, dated August 27, and September 17, 1692.

⁴ Dated $\frac{7}{17}$ March 1693, published in Raphson's *Fluxions*, pp. 119, 120.

Newton, in which he mentioned his expectation of receiving from him something great on the subjects of tangents and quadratures; but especially, what he particularly wished, his method of reducing quadratures to the rectifications of curves. In consequence, however, of having mislaid this letter, Newton wrote to him the day after he found it,¹ apologizing for the delay, and transmitting the method he requested. He mentions to him also that he had sent to Wallis a brief explanation of his method of fluxions, which he had previously concealed, and expressed the hope that he had written nothing which would be displeasing to him. "But," he added, "if he found in it anything worthy of reprehension, he hoped he would signify it to him in writing, as he valued friends more than mathematical inventions."

While Newton was corresponding with Locke in 1692, the process of Boyle for "multiplying gold," by combining a certain red earth with mercury, became the subject of discussion. Mr. Boyle having "left the inspection of his papers" to Locke, Dr. Dickison, and Dr. Cox, Mr. Locke became acquainted with the particulars of the process we have referred to. Boyle had, before his death, communicated this process both to Locke and Newton, and procured some of the red earth for his friends. Having received some of this earth from Locke, Newton tells him, that, though he has "no inclination to prosecute the process," yet, as he had "a mind to prosecute it," he would "be glad to assist him," though "he feared he had lost the first and third of the process out of his pocket." He goes on to thank Locke for "what he communicated to him out of his own notes about it," and adds, in a postscript, that "when the hot weather is over, he intends to try the beginning (that is the first of the three parts of the recipe), though the success seems improbable."²

¹ This letter is dated Cambridge, $\frac{1}{2}$ $\frac{6}{8}$ October 1693, and is published in Edlestone's *Correspondence, &c.*, Appendix, No. xxiv. p. 276.

² This letter, of which there is only a fragment, is dated Cambridge, July 7, 1692, and is published in Edlestone's *Correspondence, &c.*, Appendix, No. xxiii. p. 275.

In Locke's answer of the 26th July,¹ he sends to Newton a transcript of two of Boyle's papers, as he knew he wished it ; and it is obvious from their letters, that both of them were desirous of "multiplying gold." In Newton's very interesting reply² to this communication, he "dissuades Locke against incurring any expense by a too hasty trial of the recipe." He says, that several chemists were engaged in trying the process, and that Mr. Boyle, in communicating it to himself, "had reserved a part of it from my knowledge, though I knew more of it than he has told me." This mystery on the part of Boyle is very remarkable. In "offering his secret" to Newton and Locke, he imposed conditions upon them, while, in the case of Newton at least, he did not perform his own part in the arrangement. On another occasion, when he communicated two experiments in return for one, "he cumbered them," says Newton, "with such circumstances as startled me, and made me afraid of any more." It is a curious fact, as appears from this letter, that there was then a Company established in London to multiply gold by this recipe, which Newton "takes to be the thing for the sake of which Mr. Boyle procured the repeal of the Acts of Parliament against multipliers." The pretended truths in alchemy were received by men like Boyle on the same kind of evidence as that by which the phrenology and clairvoyance of modern times have been supported. Although Boyle possessed the golden recipe for twenty years, yet Newton could not find that he had "either tried it himself, or got it tried successfully by anybody else ; for," he says, "when I spoke doubtingly about it, he confessed that he had not seen it tried, but added, *that a certain gentleman was now about it, and it succeeded very well so far as he had gone, and that all the signs appeared, so that I needed not doubt of it.*"

¹ I have given this unpublished letter in the APPENDIX, No. VII.

² August 2, 1692, published in King's *Life of Locke*, vol. ii. pp. 410-414.

CHAPTER XVII.

Newton's health impaired—The Boyle Lectures by Bentley, who requests Newton's assistance—Newton's first Letter to Bentley on the formation of the Sun and Planets—His second Letter—Rotation of the Planets the result of Divine Power—His third Letter—Hypothesis of Matter evenly diffused—Letter of Bentley to Newton—Reply to it by Newton in a fourth Letter—Opinion of Plato examined—Supposed mental illness of Newton ascribed to the burning of his MSS.—Referred to in the Letters of Huygens and Leibnitz—Made public by M. Biot—mentioned in the Diary of Mr. de la Pryme—The Story referred to disproved—Newton's Papers burnt before 1684—Newton's Letter to Mr. Pepys—Letter of Mr. Pepys to Mr. Millington—Mr. Millington's Reply—Mr. Pepys' second Letter to Mr. Millington—Newton solves a Problem in Chances—His letter to Locke—Reply of Locke—Newton's Answer, explaining the cause of his illness—His Critical Letter to Dr. Mill—His mind never in a state of derangement, but fitted for the highest intellectual efforts.

IN the autumn of 1692, when Newton had finished his letters on fluxions, he did not enjoy that degree of health with which he had so long been favoured. The loss of appetite and want of sleep, of which he now complained, and which continued for nearly a twelvemonth, could not fail to diminish that mental vigour, and that "consistency of mind," as he himself calls it, which he had hitherto displayed. How far this ailment may have arisen from the disappointment which he experienced in the application of his friends for a permanent situation for him, we have not the means of ascertaining, but it is impossible to read his letters to Locke, and other letters from his friends, without perceiving that a painful impression had been left upon his mind, as well as upon theirs. This state of his health, however, did not unfit him for studies that required perhaps more profound thought than his letters on fluxions and fluents, for it was at the close of 1692, and during the first two months of

1693, that he composed his four celebrated letters to Dr. Bentley.¹

Upon the death of the celebrated Robert Boyle, who died on the 30th December 1691, it was found that, in a codicil to his will, he had left £50 per annum to establish a lectureship, in which eight discourses were to be preached annually in one of the churches of the metropolis, in illustration of the evidences of Christianity, and in opposition to the principles of infidelity. Dr. Bentley, then chaplain to the Bishop of Worcester, and a very young man, was appointed to preach the first course of sermons, and the manner in which he discharged this important duty gave the highest satisfaction not only to the trustees of the lectureship, but to the public in general. In the first six lectures Bentley exposed the folly of atheism even in reference to the present life, and derived powerful arguments for the existence of a Deity from the faculties of the soul, and the structure and functions of the human frame. In order to complete his plan, he proposed to devote his seventh and eighth lectures to the demonstration of a Divine Providence from the physical constitution of the universe, as established in the *Principia*. To qualify himself for this task, he received from Sir Isaac Newton directions respecting a list of books necessary to be perused previous to the study of that work ;² and having made himself master of the system which it contained, he applied it with irresistible force of argument to establish the existence of an overruling mind. Previous to the publication of these lectures, Bentley encountered a difficulty which he was not able to solve, and he transmitted to Sir Isaac, during 1692, a series of queries on the subject. This difficulty occurred in an argument urged by Lucretius, to prove the eternity of the world

¹ These letters, which were first printed by Richard Cumberland in 1756, and reviewed by Dr. Samuel Johnson in the *Literary Magazine*, vol. i. p. 89, have been reprinted in Dr. Horsley's *Newtoni Opera*, vol. iv. pp. 429-442; and in Nichol's *Illustrations of the Literary History of the Eighteenth Century*, vol. iv. pp. 50-60; but in both these works, the *third* and *fourth* letters are transposed, as their dates will show.

² See vol. i. APPENDIX, No. XI. p. 420.

from a hypothesis of deriving the frame of it, by mechanical principles, from matter endowed with an innate power of gravity, and evenly scattered throughout the heavens. Sir Isaac willingly entered upon the consideration of the subject, and transmitted his sentiments to Dr. Bentley in the four letters which we have mentioned.

In the *First*¹ of these letters Sir Isaac informs him, that when he wrote his treatise about our system, viz., the Third Book of the *Principia*, “he had an eye upon such principles as might work, with considering men, for the belief of a Deity,” and he expresses his happiness that it has been found useful for that purpose. “But if I have done,” he adds, “the public any service this way, it is due to nothing but industry and patient thought.” In answering the first query of Dr. Bentley, the exact import of which we do not know, he states, that, if matter were evenly diffused through a finite space, and endowed with innate gravity, it would fall down into the middle of the space, and form one great spherical mass; but if it were diffused through an infinite space, some of it would collect into one mass, and some into another, so as to form an infinite number of great masses. In this manner the sun and stars might be formed if the matter were of a lucid nature. But he thinks it inexplicable by natural causes, and to be ascribed to the counsel and contrivance of a voluntary agent, that the matter should divide itself into two sorts, part of it composing a shining body like the sun, and part an opaque body like the planets. Had a natural and blind cause, without contrivance and design, placed the earth in the centre of the moon’s orbit, and Jupiter in the centre of his system of satellites, and the sun in the centre of the planetary system, the sun would have been a body like Jupiter and the earth, that is, without light and heat; and consequently, he knows no reason why there is

¹ Dated December 10, 1692. This letter is indorsed in Bentley’s hand.—“Mr. Newton’s answer to some queries sent by me after I had preached my two last sermons.”—Monk’s *Life of Bentley*, p. 34, note.

only one body qualified to give light and heat to all the rest, but because the Author of the system thought it convenient, and because one was sufficient to warm and enlighten all the rest.

To the second query of Dr. Bentley, he replies that the motions which the planets now have could not spring from any natural cause alone, but were impressed by an intelligent agent. "To make such a system with all its motions, required a cause which understood, and compared together the quantities of matter in the several bodies of the sun and planets, and the gravitating powers resulting from thence; the several distances of the primary planets from the sun, and of the secondary ones from Saturn, Jupiter, and the earth, and the velocities with which those planets could revolve about those quantities of matter in the central bodies; and to compare and adjust all these things together in so great a variety of bodies, argues that cause to be not blind and fortuitous, but very well skilled in mechanics and geometry." In his answer to the third query, he expresses the opinion that the interior parts of all the planets are "as much heated, concocted, and coagulated by interior fermentation as our earth is," and that the exterior planets, Jupiter and Saturn, have a smaller density than the rest, not because they are at a greater distance from the sun, but because if their density had been greater they would "have caused a considerable disturbance in the whole system."

In answering the fourth query, he says that, in the system of vortices, even if "the sun could, by his rays, carry about the planets, yet he does not see how he could thereby effect their diurnal motion."

In the *Second* letter,¹ he admits that the spherical mass formed by the aggregation of particles would affect the figure of the space in which the matter was diffused, provided the matter descends directly downwards to that body, and the body has no diurnal rotation; but he states, that by earthquakes loosening the parts of this solid, the protuberances might sink

¹ Dated Jan. 17, 1692-3.

a little by their weight, and the mass by degrees approach a spherical figure. He then proceeds to correct an error of Dr. Bentley's in supposing that all infinites are equal, and refers him for information to Dr. Wallis's Arithmetic of Infinites. He admits that gravity might put the planets in motion, but he maintains that, without the Divine power, it could never give them such a circulating motion as they have about the sun, because a proper quantity of a transverse motion is necessary for this purpose ; and he concludes that he is compelled to ascribe the frame of this system to an intelligent agent.

In the *Third* letter,¹ he states, that the hypothesis that matter is at first evenly diffused through the universe, is in his opinion inconsistent with the hypothesis of innate gravity without a supernatural power to reconcile them, and therefore it infers a Deity. "For if there be innate gravity, it is impossible now for the matter of the earth and all the planets and stars to fly up from them, and become evenly spread throughout all the heavens without a supernatural power ; and certainly that which can never be hereafter without a supernatural power, could never be heretofore without the same power."

Having learned from his bookseller that the publication of his sermons might be delayed, Bentley, upon the receipt of the preceding letter, wrote to Newton a long letter,² containing "an abstract, and thread of his first unpublished sermon," and requested him, in order to make "his mind at ease," to "acquaint him with what he found in it not conformable to truth and his hypothesis." In citing, in his abstract, Newton's opinions on gravity, he gives the full passage in his sermon, and adds in a parenthesis, "I have written these words at large that you may see if I am tender enough how I engage your name in this matter."

To this letter Newton replied in a few days by a fourth

¹ Dated February 11, 1693.

² Dated February 19, 1693, and printed in APPENDIX, No. VIII. This is the only letter of Bentley's on this subject which I have found among the Portsmouth Papers.

letter¹ of great interest, and touching on all the points to which his correspondent, had called his attention.

The *Fourth* letter contains opinions confirming or correcting several positions which Dr. Bentley had laid down, and closes with a curious examination of the opinion of Plato, that the motion of the planets is such as if they had been all created by God in some region very remote from our system, and let fall from thence towards the sun, their falling motion being turned aside into a transverse one whenever they arrived at their several orbits. Sir Isaac shows that there is no common place such as that conjectured by Plato, provided the gravitating power of the sun remains constant ; but that Plato's affirmation is true if we suppose the gravitating power of the sun to be doubled at that moment of time when they all arrive at their several orbits. " If we suppose," says he, " the gravity of all the planets towards the sun to be of such a quantity as it really is, and that the motions of the planets are turned upwards, every planet will ascend to twice its height from the sun. Saturn will ascend till he be twice as high from the sun as he is at present, and no higher ; Jupiter will ascend as high again as at present, that is, a little above the orb of Saturn ; Mercury will ascend to twice his present height, that is, to the orb of Venus ; and so of the rest ; and then, by falling down again from the places to which they ascended, they will arrive again at their several orbs with the same velocities they had at first, and with which they now revolve.

" But if, so soon as their motions by which they revolve are turned upwards, the gravitating power of the sun, by which their ascent is perpetually retarded, be diminished by one-half, they will now ascend perpetually, and all of them, at all equal distances from the sun, will be equally swift. Mercury, when he arrives at the orb of Venus, will be as swift as Venus ; and he and Venus, when they arrive at the orb of the earth, will be as swift as the earth ; and so of the rest. If they begin

¹ Dated February 25, 1693.

all of them to ascend at once, and ascend in the same line, they will constantly, in ascending, become nearer and nearer together, and their motions will constantly approach to an equality, and become at length slower than any motion assignable. Suppose, therefore, that they ascended till they were almost contiguous, and their motions inconsiderably little, and that all their motions were at the same moment of time turned back again, or, which comes almost to the same thing, that they were only deprived of their motions, and let fall at that time, they would all at once arrive at their several orbs, each with the velocity it had at first; and if their motions were then turned sideways, and at the same time the gravitating power of the sun doubled, that it might be strong enough to retain them in their orbs, they would revolve in them as before their ascent. But if the gravitating power of the sun was not doubled, they would go away from their orbs into the highest heavens in parabolical lines.”¹

These letters, of which we have endeavoured to give a brief summary, will well repay the most attentive perusal by the philosopher as well as the divine. They are written with much perspicuity of language, and great power of thought, and contain results which incontestably prove that their author was fully master of his noblest faculties, and comprehended the profoundest parts of his own writings.² In the present day they possess a peculiar interest. They show that the *Nebular hypo-*

¹ “These things,” says he, “follow from my *Principia Math.*, lib. i. prop. 33-36.”

² The originals of these four letters “were given by Dr. Richard Bentley to Richard Cumberland, his nephew and executor, while a student at Trinity College, and were printed by him in a separate pamphlet in 1756. This publication was reviewed by Dr. Samuel Johnson in the *Literary Magazine*, vol. i. p. 89. See Johnson’s Works, vol. ii. p. 328. In one or two cases Newton acknowledges that he had not before considered some of the conclusions from his own discoveries, and that some of the queries proposed by Bentley were new to him. Whence Dr. Johnson beautifully remarks “how even the mind of Newton gains ground gradually upon darkness.” Dr. Monk, who notices this remark, justly observes, that as Bentley “availed himself of all the suggestions of his illustrious correspondent, his reasonings and conclusions appear with the highest of all human sanctions, and this department of natural theology has perhaps never yet been so satisfactorily illustrated.”—*Life of Bentley*, p. 34.

thesis, the dull and dangerous heresy of the age, is incompatible with the established laws of the material universe, and that an omnipotent arm was required to give the planets their position and motions in space, and a presiding intelligence to assign to them the different functions they had to perform.¹

The illness of Newton, which increased till the autumn of 1693, was singularly misrepresented by foreign contemporary authors, to whom an erroneous account of it had been communicated. During the century and a half which has elapsed since that event, it has never been mentioned by any of his biographers; and it was not till 1822 that it was brought before the public as a remarkable event in the life of Newton. The celebrated Dutch philosopher, Van Swinden, made the following communication to M. Biot, who published it,² with comments, that gave great offence to the friends of Newton:—

“There is among the manuscripts of the celebrated Huygens,” says Van Swinden, “a small journal in folio, in which he used to note down different occurrences. It is note ζ, No. 8, in the Catalogue of the Library of Leyden, p. 112. The following extract is written by Huygens himself, with whose handwriting I am well acquainted, having had occasion to peruse several of his manuscript and autograph letters:—

“*On the 29th May 1694, M. Colin,³ a Scotchman, informed me, that eighteen months ago the illustrious geometer, Isaac Newton, had become insane, either in consequence of his too*

¹ The views of Newton and Bentley, so distinctive of the College which they adorned, have been maintained and illustrated, with all the lights of modern science, by Professor Sedgwick in his noble *Discourse on the Studies of the University*.

² Life of Newton, *Biog. Universelle*, tom. xxxi. p. 168.

³ It appears from a letter of Newton to Flamsteed, that he had proposed Sir Collins, of “this University,” as one of the candidates for the vacancy in Christ Hospital, occasioned by the resignation of Mr. Paget. He thought that he had mathematics enough, though young and inexperienced. From Flamsteed’s unpublished reply to this letter, it would appear that Sir Collins was a son of John Collins, Newton’s great and early friend. “Young Collins,” he says, “may live to restore it (the Hospital), whom, therefore, you may do well to encourage to mind these studies. I doubt not he will be good in algebra; that was his father’s talent. Astronomy will be most useful in the school. Our teachers in town understand little of it. Pray advise him to study the theory of

intense application to his studies, or from excessive grief at having lost, by fire, his chemical laboratory and several manuscripts. When he came to the Archbishop of Cambridge, he made some observations which indicated an alienation of mind. He was immediately taken care of by his friends, who confined him to his house, and applied remedies, by means of which he had now so far recovered his health that he began to understand the Principia.'"¹ Huygens mentioned this circumstance in a letter to Leibnitz, dated 8th June 1694,² in the following terms:—"I do not know if you are acquainted with the accident which has happened to the good Mr. Newton, namely, that he has had an attack of phrenitis, which lasted eighteen months, and of which they say that his friends have cured him by means of remedies, and keeping him shut up." To which Leibnitz replied in a letter, dated the 22d June:—"I am very glad that I received information of the cure of Mr. Newton at the same time that I first heard of his illness, which doubtless the planets, and to make himself expert in calculation. Though I never saw him, yet for his father's sake, my good friend, and his own good report, he shall find me always ready to serve him."—April 27, 1695.

¹ M. Uylenbroek, the editor of the correspondence between Huygens and Leibnitz, has given in an appendix the correct text of this passage, with his own observations upon it:—

"29 Maj. 1694.—Narravit mihi D. Colm (not Colin) Scotus virum celeberrimum ac summum geometram Is. Neutonum in phrenesin incidisse abhinc anno et sex mensibus. An ex nimia studii assiduitate, an dolore infortunii, quod incendio laboratorium chymicum et scripta quædam amiserat? Cum ad Archiepiscopum Cantabrigiensem (Cantuariensem, as Mr. Edleston conjectures) venisset, ea locutum, quæ alienationem mentis indicarent. Deinde ab amicis cura ejus susceptam, domoque clauso remedia volenti nolenti adhibita, quibus jam sanitatem recuperavit, ut jam rursus librum suum Principiorum Philosophiæ Mathematicorum intelligere incipiat."

M. Uylenbroek adds his own opinion of the matter, as explained in my former Life of Newton:—"Hæc Colmi narratio, quam ex his ipsis MSS., Hugenienſis petitam, quondam evulgaverat Biotus, nuperrime Brewſtero ansam præbuit inquirendi utrum revera Newtonus mentis morbo correptus fuerit necne. Testimonia, quæ attulit vir Cl. ea esse videntur e quibus probabiliter efficias Newtonum, currente anno 1692, solita mentis, corporisque valetudine non fuisse usum, at non ita eum morbo decubuisse ut eo impeditus fuerit quo minus studiis suis vacaret."—Christiani Hugenii *Exercitationes Mathematicæ*. Ed. P. J. Uylenbroek, fascic. ii. p. 171, Hag. An. 1833.

² He made the same communication to the Marquis L'Hospital on the 16th June.—Ch. Hug. *Exercit. Math.* fascic. i. p. 318.

must have been very alarming. 'It is to men like you and him, sir, that I wish a long life and much health, more than others, whose loss, comparatively speaking, would not be so great.'"¹

The first publication of the preceding statement produced a strong sensation among the friends and admirers of Newton. They could not easily believe in the prostration of that intellectual strength which had unbarred the strongholds of the universe. The unbroken equanimity of Newton's mind, the purity of his moral character, his temperate and abstemious life, his ardent and unaffected piety, and the weakness of his imaginative powers, all indicated a mind which was not likely to be overset by any affliction to which it could be exposed. The loss of a few experimental records could never have disturbed the equilibrium of a mind like his. If they were the records of discoveries, the discoveries, themselves indestructible, would have been afterwards given to the world. If they were merely the details of experimental results, a little time could have easily reproduced them. Had these records contained the first-fruits of youthful genius—of obscure talent, on which fame had not yet shed its rays, we might have supposed that the first blight of early ambition would have unsettled the stability of a mind unannealed by the world. But Newton was satiated with fame. His mightiest discoveries were completed, and diffused over all Europe, and he must have felt himself placed on the loftiest pinnacle of earthly ambition. The incredulity which such views could not fail to encourage, was increased by the novelty of the information. No English biographer had ever alluded to such an event. History and tradition were equally silent, and it was not easy to believe that the Lucasian Professor of Mathematics at Cambridge, recently a Member of the English Parliament, and the first philosopher and mathematician in Europe, could have lost his reason without the dreadful fact being known to his countrymen.

But if the friends of Newton were surprised by the nature of

¹ Ch. Hug. *Exercit. Math.* fascic. i. p. 182.

the intelligence, they were distressed at the view which was taken of it by foreign philosophers. "The fact," says M. Biot, "of the derangement of his intellect, whatever may have been the cause of it, will explain why, after the publication of the *Principia* in 1687, Newton, though only forty-five years old, never more published a new work on any branch of science, but contented himself with giving to the world those which he had composed long before that epoch, confining himself to the completion of those parts which might require development. We may also remark, that even these developments appear always to be derived from experiments and observations formerly made, such as the additions to the second edition of the *Principia*, published in 1713, the experiments on thick plates, those on diffraction, and the chemical queries placed at the end of the *Optics* in 1704 ; for in giving an account of these experiments Newton distinctly says, that they were taken from ancient manuscripts which he had formerly composed ; and he adds, that though he felt the necessity of extending them, or rendering them more perfect, he was not able to resolve to do this, these matters being no longer in his way. Thus it appears that though he had recovered his health sufficiently to understand all his researches, and even in some cases to make additions to them, and useful alterations, as appears from the second edition of the *Principia*, for which he kept up a very active mathematical correspondence with Mr. Cotes, yet he did not wish to undertake new labours in those departments of science where he had done so much, and where he so distinctly saw what remained to be done." Under the influence of the same opinion, M. Biot finds it "extremely probable that his dissertation on the scale of heat was written before the fire in his laboratory ;" and he describes Newton's conduct about the longitude bill as exhibiting an inexplicable timidity of mind, and as "so puerile for so solemn an occasion, that it might lead to the strangest conclusions, particularly if we refer it to the fatal accident which befell him in 1695."

The illness of Newton was viewed in a light still more painful to his friends. It was maintained that he never recovered the vigour of his intellect, and that his theological inquiries did not commence till after that afflicting epoch of his life. In reply to this groundless assertion, it may be sufficient to state, in the words of his friend John Craig,¹ that his theological writings were composed "while his understanding was in its greatest perfection, lest the infidels might pretend that his applying himself to the study of religion was the effect of dotage."

eviden
PROOF

Such having been the consequences of the disclosure of Newton's illness by the manuscript of Huygens, I felt it to be a sacred duty to the memory of that great man, and to the feelings of his countrymen, to inquire into the nature and history of that indisposition which seems to have been so much misrepresented and misapplied. From the ignorance of so extraordinary an event which has prevailed for such a long period in England, it might have been urged with some plausibility, that Huygens had mistaken the real import of the information that was conveyed to him; or that the person from whom he received it had propagated an idle and a groundless rumour. But we are fortunately not confined to this very reasonable mode of defence. There exists at Cambridge a manuscript journal written by Mr. Abraham de la Pryme, who was a student in the University while Newton was a Fellow of Trinity. This manuscript is entitled "*Ephemeris Vitæ*, or Diary of my own Life, containing an account likewise of the most observable and remarkable things that I have taken notice of from my youth up hitherto." Mr. A. de la Pryme was born in 1671, and begins the Diary in 1685. This manuscript is in the possession of his collateral descendant, George Pryme, Esq., Professor of Political Economy at Cambridge, to whom I have been indebted for the following extract, which is given verbatim, and occurs during the period when Mr. de la Pryme was a student in St. John's College, Cambridge:—

¹ Unpublished letter to Conduitt, April 7, 1727.

“ 1692, *February 3d.*—What I heard to-day I must relate. There is one Mr. Newton (whom I have very oft seen), Fellow of Trinity College, that is mighty famous for his learning, being a most excellent mathematician, philosopher, divine, &c. He has been Fellow of the Royal Society these many years ; and amongst other very learned books and tracts he’s written one upon the mathematical principles of philosophy, which has got him a mighty name, he having received, especially from Scotland, abundance of congratulatory letters for the same ; but of all the books that he ever wrote, there was one of colours and light, established upon thousands of experiments, which he had been twenty years of making, and which had cost him many hundred of pounds. This book, which he valued so much, and which was so much talked of, had the ill luck to perish, and be utterly lost, just when the learned author was almost at putting a conclusion at the same, after this manner :—In a winter’s morning, leaving it amongst his other papers on his study table whilst he went to chapel, the candle, which he had unfortunately left burning there too, caught hold by some means of other papers, and they fired the aforesaid book, and utterly consumed it and several other valuable writings ; and, which is most wonderful, did no further mischief. But when Mr. Newton came from chapel, and had seen what was done, every one thought he would have run mad, he was so troubled thereat that he was not himself for a month after. A long account of this his system of light and colours you may find in the Transactions of the Royal Society, which he had sent up to them long before this sad mischance happened unto him.”

The story of the burning of Newton’s laboratory and papers, as stated by Mr. de la Pryme, has been greatly exaggerated and misrepresented, and there can be no doubt that it was entirely unconnected with Newton’s illness. Mr. Edleston¹ has placed it beyond a doubt that the burning of the manuscripts took place between 1677 and 1683, and I have found ample

¹ *Correspondence*, &c. pp. lxii. lxiii.

confirmation of the fact from other sources of information. Dr. H. Newton, as we have seen, tells us that he had heard a report that Newton's *Optics* had been burnt before he wrote his *Principia*, and we know that no such accident took place during the five years that Dr. Newton lived with him at Cambridge. The following memorandum of Mr. Conduitt's, written after conversing on the subject with Newton himself, appears to place the event at an early period :—" When he was in the warmest pursuit of his discoveries, he going out, left a candle upon his table amongst his papers, he went down into the bowling-green, and meeting somebody who diverted him from returning as he intended, the candle set fire to his papers (and he could never recover them¹). Upon my asking him whether they related to his *Optics* or the *Method of Fluxions*, he said he believed there was some relating to both, and that he was obliged to work them all over again." The version of the burnt papers in which "Diamond" is made the perpetrator, and in which the scene of the story is laid in London, and in Newton's later years, we may consign to a note, with the remark of Dr. Humphrey Newton, that Sir Isaac never had any communion with dogs or cats.²

¹ This observation, which is in another edition of the manuscript, is not inconsistent with the statement of Newton's having "worked them over again."

² "Newton's temper was so mild and equal, that scarce any accident disturbed him. One instance in particular, which is authenticated by a person now living (1780), brings this assertion to a proof. Sir Isaac being called out of his study to a contiguous room, a little dog called Diamond, the constant but incurious attendant of his master's researches, happened to be left among the papers, and by a fatality not to be retrieved, as it was in the latter part of Sir Isaac's days, threw down a lighted candle, which consumed the almost finished labours of some years. Sir Isaac returning too late but to behold the dreadful wreck, rebuked the author of it with an exclamation (*ad sidera palmas*), 'O Diamond! Diamond! thou little knowest the mischief done!' without adding a single stripe."—Notes to Maude's *Wensleydale*, p. 102, 4th edit. 1816. M. Biot gives this piece of fiction as a true story, which happened in some year after the publication of the *Principia*, and he characterizes the accident as having deprived the sciences for ever of the fruit of so much of Newton's labours. Dr. Wallis received another edition of the story from his correspondent Sturm, a professor at Altorf. "Sturm sends me word of a rumour amongst them concerning Mr. Newton, as if *his house and books, and all his goods were burnt*, and himself so disturbed in mind thereupon as to be reduced to very

By means of this extract from Mr. de la Pryme's Diary, we are enabled to fix the latest date of the accident by which Newton lost his papers. It must have been previous to the 3d January 1692, a month before the date of the extract; but if we fix it by the dates in Huygens' manuscript, we should place it about the 29th November 1692, eighteen months previous to the conversation between Colin and Huygens. The manner in which Mr. Pryme refers to Newton's state of mind is that which is used every day when we speak of the loss of tranquillity which arises from the ordinary afflictions of life; and the meaning of the passage amounts to nothing more than that Newton was very much troubled by the destruction of his papers, and did not recover his serenity, and return to his usual occupations, for a month. The very phrase, that every person thought he would have run mad, is in itself a proof that no such effect was produced; and, whatever degree of indisposition may be implied in the phrase, "he was *not himself* for a month after," we are entitled to infer that one month was the period of its duration, and that previous to the 3d February 1692, the date of Mr. Pryme's memorandum, "Newton was himself again."¹

These facts and dates cannot be reconciled with those in Huygens' manuscript.² It appears from that document, that, so late as May 1694, Newton had only *so far* recovered his health as *to begin to again understand the Principia*. His

ill circumstances; which being all false, I thought fit presently to rectify that groundless mistake."—Letter to Waller, Secretary to the Royal Society, quoted by Mr. Edleston from the Letter-book of the Royal Society. See pp. 93 and 97.

¹ We entirely concur with Mr. Edleston in his opinion that this story refers to an antecedent period. It is obviously a repetition of the story referred to by Dr. Newton respecting the burning of the *Optics* before 1684.

² In the *Journal des Savans*, 1832, p. 295, M. Biot has tried to reconcile these facts and dates by arguments which have been so ably exposed and refuted by Mr. Edleston, who entirely concurs with the view I have taken of the subject, that any further controversy is unnecessary. The evidence of Dr. Humphrey Newton leaves no doubt whatever that the fire in Sir Isaac's room took place before 1684.—See *Correspondence*, &c. pp. lx.-lx.i.

supposed malady, therefore, was in force from the 3d of January 1692, till the month of May 1694,—a period of more than two years. Now, it is a most important circumstance, which M. Biot ought to have known, that in *the very middle of this period*, Newton wrote his four celebrated letters to Dr. Bentley on the Existence of a Deity,—letters which evince a power of thought and a serenity of mind absolutely incompatible even with the slightest obscuration of his faculties. No man can peruse these letters without the conviction that their author then possessed the full vigour of his reason, and was capable of understanding the most profound parts of his writings. The first of these letters was written on the 10th December 1692, the second on the 17th January 1693, the third on the 11th February, and the fourth on the 25th February 1693. His mind was, therefore, strong and vigorous on these four occasions; and as the letters were written at the express request of Dr. Bentley, to assist him in preparing his lectures for publication, we must consider such a request as showing his opinion of the strength and freshness of his friend's mental powers.

In August and September 1692, as we have already seen, Newton transmitted to Dr. Wallis the first proposition of his book on quadratures, with examples of it in first, second, and third fluxions.¹ These examples were written at the request of his friend; and the author of the review of the *Commercium Epistolicum*, in which this fact is quoted, draws the conclusion, that he had not at that time forgotten his method of second fluxions. It appears, also, from the second book of the *Optics*,² that in the month of June 1692, he had been occupied with the subject of haloes, and had made accurate observations both on the colours and the diameters of the rings in a halo which he had then seen around the sun. We find also from his manuscripts, that he was deeply engaged in chemical experiments in

¹ See *Newtoni Opera*, tom. iv. p. 480; and *Wallisii Opera*, 1693, tom. ii. pp. 391-396.

² *Optics*, part iv. obs. 13.

the months of December 1692 and January 1693 ; and on the 26th October 1693, he wrote a letter to Leibnitz, giving him, at his request, an account of his method of reducing quadratures to the rectification of curves, and, three months afterwards, another letter to Dr. Mill at Oxford.¹ In addition to these facts, it may be useful to mention that Facio Duillier visited Newton at Cambridge in the middle of November 1692 ;² and it is evident from Facio's letter to him, dated November 17, and from a letter of Newton's to Facio of the 14th March 1693,³ that he was in comparatively good health.

But though these facts stand in direct contradiction to the statement recorded by Huygens, the reader will be naturally anxious to know the real nature and extent of the indisposition to which it probably refers. The following letters, written by Newton himself to Mr. Pepys, Secretary to the Admiralty, and Mr. Millington of Magdalene College, Cambridge, for which I have been indebted to the kindness of Lord Braybrooke, will throw much light upon the subject.

Newton, as will be presently seen, had fallen into a bad state of health in the autumn of 1692, in consequence of which both his sleep and his appetite were greatly affected. About the middle of September 1693, he had been kept awake for five nights by this nervous disorder, and in this condition he wrote the following letter to Mr. Pepys :—

“ September 13, 1693.

“ SIR,—Some time after Mr. Millington had delivered your message, he pressed me to see you the next time I went to London. I was averse ; but upon his pressing consented, before I considered what I did, for I am extremely troubled at the embroilment I am in, and have neither ate nor slept well this twelvemonth, nor have my former consistency of mind. I never designed to get anything by your interest, nor by King James's

¹ Dated January 29, 1694.

² See p. 2.

³ *Gentleman's Magazine*, tom. lxxxiv. p. 3, 1814.

favour, but am now sensible that I must withdraw from your acquaintance, and see neither you nor the rest of my friends any more, if I may but leave them quietly. I beg your pardon for saying I would see you again, and rest your most humble and most obedient servant,

“ IS. NEWTON.”

From this letter we learn, on his own authority, that his complaint had lasted for a twelvemonth, and that during that period he neither ate nor slept well, nor enjoyed his former *consistency of mind*. It is not easy to understand exactly what is meant by not enjoying his former consistency of mind; but whatever be its import, it is obvious that he must have been in a state of mind which enabled him to compose the four letters to Bentley, and the other productions we have mentioned.

On the receipt of this letter, his friend, Mr. Pepys, seems to have written to Mr. Millington, to inquire after Mr. Newton's health; but the inquiry having been made in a vague manner, an answer equally vague was returned. Mr. Pepys, however, who seems to have been deeply anxious about Newton's health, addressed the following more explicit letter to Mr. Millington:—

“ September 26, 1693.

“ SIR,—After acknowledging your many old favours, give me leave to do it a little more particularly upon occasion of the new one conveyed to me by my nephew Jackson. Though, at the same time, I must acknowledge myself not at the ease I would be glad to be at in reference to the excellent Mr. Newton; concerning whom (methinks) your answer labours under the same kind of restraint which (to tell you the truth) my asking did. For I was loth at first dash to tell you that I had lately received a letter from him so surprising to me for the inconsistency of every part of it, as to be put into great disorder by it, from the concernment I have for him, lest it should arise from that which of all mankind I should least dread from him and most lament for,—I mean a discomposure in head, or mind,

or both. Let me, therefore, beg you, Sir, having now told you the true ground of the trouble I lately gave you, to let me know the very truth of the matter, as far at least as comes within your knowledge. For I own too great an esteem for Mr. Newton, as for a public good, to be able to let any doubt in me of this kind concerning him lie a moment uncleared, where I can have any hopes of helping it.—I am, with great truth and respect, dear Sir, your most humble and most affectionate servant,

“ S. PEPYS.”

To this letter Mr. Millington made the following reply :—

“ COLL. MAGD. CAMB., *Sept. the 30, 1693.*”

“ HONOR'D SIR,—Coming home from a journey on the 28th instant at night, I met with your letter which you were pleased to honour me with of the 26th. I am much troubled I was not at home in time for the post, that I might as soon as possible put you out of your generous payne that you are in for the worthy Mr. Newton. I was, I must confess, very much surprised at the inquiry you were pleased to make by your nephew about the message that Mr. Newton made the ground of his letter to you, for I was very sure I never either received from you or delivered to him any such ; and therefore I went immediately to wayt upon him, with a design to discourse him about the matter, but he was out of town, and since I have not seen him, till upon the 28th I met him at Huntingdon, where, upon his own accord, and before I had time to ask him any question, he told me that he had writt to you a very odd letter, at which he was much concerned ; added, that it was in a distemper that much seized his head, and that kept him awake for above five nights together, which upon occasion he desired I would represent to you, and beg your pardon, he being very much ashamed he should be so rude to a person for whom he hath so great an honour. He is now very well, and, though I fear he is under some small degree of melancholy, yet I think

there is no reason to suspect it hath at all touched his understanding, and I hope never will ; and so I am sure all ought to wish that love learning or the honour of our nation, *which it is a sign how much it is looked after, when such a person as Mr. Newton lyes so neglected by those in power.* And thus, honoured Sir, I have made you acquainted with all I know of the cause of such inconsistencies in the letter of so excellent a person ; and I hope it will remove the doubts and fears you are, with so much compassion and publickness of spirit, pleased to entertain about Mr. Newton ; but if I should have been wanting in any thing tending to the more full satisfaction, I shall, upon the least notice, endeavour to amend it with all gratitude and truth. Honored Sir, your most faithfull and most obedient servant,

“ JOH. MILLINGTON.”

Mr. Pepys was perfectly satisfied with this answer, as appears from the following letter :—

“ October 3d, 1693.

“ SIR,—You have delivered me from a fear that indeed gave me much trouble, and from my very heart I thank you for it, an evil to Mr. Newton being what every good man must feel for his own sake as well as his. God grant it may stopp here. And for the kind reflection hee has since made upon his letter to mee, I dare not take upon mee to judge what answer I should make him to it, or whether any or no ; and therefore pray that you will bee pleased either to bestow on mee what directions you see fitt for my own guidance towards him in it, or to say to him in my name, but your own pleasure, whatever you think may be most welcome to him upon it, and most expressive of my regard and affectionate esteem of him, and concernment for him. I have a debt to acknowledge to you (but was prevented in my last, by the thoughts I was then overborne with in this matter), from the great satisfaction you was pleased to give me by your pupil (on whose behalf I have lasting thanks also to pay you) to my enquiries about Mr. Pyets,

beseeching you to make the same scruplelesse use of me in whatever relation you can think me capable of rendering you any service, for I would do it with great pleasure, remaining, dear Sir, your most humble and most faithful servant,

“ S. PEPYS.”

It does not appear from the Memoirs of Mr. Pepys that he returned any answer to the letter of Mr. Newton which occasioned this correspondence ; but we find, that in less than two months after the date of the preceding letter, an opportunity occurred of introducing to him a Mr. Smith, who took a journey to Cambridge to obtain his opinion on a problem in the doctrine of chances. This problem related to “ the project of Mr. Neale, the groom-porter’s lottery,” which Pepys says Newton “ cannot but have heard of,” as it “ has almost extinguished, for some time, at all places of public conversation, especially among men of numbers, every other talk but what relates to the doctrine of determining between the true proportion of the hazards incident to this or that given chance or lot.” “ Mr. Smith,” he says, “ was concerned (more than in jest) to compass a solution, that may be relied on beyond what his modesty would suffer him to think his own alone, or any less than Mr. Newton’s to be.”

Mr. Pepys’s introductory letter was dated November 22, 1693, and Newton returned an answer on the 26th, in which he explains the ambiguity of the question as proposed to him. He takes the question, however, to be,—

“ What is the expectation of A to throw every time *one six* at least with *six* dice ?

“ What is the expectation of B to throw every time *two sixes* at least with *twelve* dice ?

“ What is the expectation of C to throw every time *three sixes* at least with *eighteen* dice ?

“ And whether has not B and C as great an expectation to hit every time what they throw for ?

“ If the question be thus stated, it appears by an easy com-

putation that the expectation of A is greater than that of B and C,—that is, the task of A is the easiest,—and the reason is because A has all the chances in sixes on his dice for his expectation ; but B and C have not all the chances upon theirs, for, when B throws a single six, or C but one or two sixes, they miss of their expectations.”

In his reply, which I have not found among the Portsmouth papers, Pepys concurred in this statement of the question, and desired to have the “easy computation.” Newton accordingly sent, on the 16th December, a table of eight progressions for making it. In returning thanks for the “easy computation,” Pepys confessed that he did not understand how to make the full use of the table of progressions, and therefore put the question in a different form. This letter is dated December 21, 1693,¹ but Newton’s answer to it has not been found. In perusing this correspondence, the mathematical reader will have no doubt of the consistency of Newton’s mind, and of its fitness for the most profound research.

It is obvious from Newton’s letter to Pepys, of the 13th September, that the subject of his receiving some favour from the Government had been a matter of anxiety with himself, and of discussion among his friends. Mr. Millington was no doubt referring to this anxiety, when he represents Newton as an honour to the nation, and expresses his surprise “that such a person should *lye so neglected by those in power.*” We have already shown that the same subject was alluded to in his letters to Locke in 1692. In all these letters Newton no doubt referred to some appointment in London which he was solicitous to obtain, and which Mr. Montague and his other friends may have failed in procuring. This opinion is confirmed by the letter of Mr. Montague, announcing to him his appointment to the wardenship of the Mint, in which he says that

¹The three first letters above-mentioned have been published by Lord Braybrooke in his *Memoirs of Samuel Pepys*, vol. ii. pp. 131-135: Lond. 1825. The fourth letter I have given in the APPENDIX, No. IX., in order to complete the published correspondence.

he is very glad he can *at last* give him good proof of his friendship.

In the same month in which Newton wrote to Mr. Pepys, we find him in correspondence with Mr. Locke. Displeased with his opinions respecting innate ideas, he had rashly stated that they struck at the root of all morality, and that he regarded the author of such doctrines as a Hobbist. Upon reconsidering these opinions, he addressed the following remarkable letter to Locke, written three days after his letter to Mr. Pepys, and consequently during the illness under which he then laboured :—

“SIR,—Being of opinion that you endeavoured to embroil me with women, and by other means, I was so much affected with it, as that when one told me you were sickly and would not live, I answered, ’twere better if you were dead. I desire you to forgive me this uncharitableness ; for I am now satisfied that what you have done is just, and I beg your pardon for my having hard thoughts of you for it, and for representing that you struck at the root of morality, in a principle you laid in your book of ideas, and designed to pursue in another book, and that I took you for a Hobbist.¹ I beg your pardon also for saying or thinking that there was a design to sell me an office, or to embroil me.—I am your most humble and unfortunate servant,

“ IS. NEWTON.

“ At the BULL, in Shoreditch, London,
Sept. 16th, 1693.”

To this letter, characterized by Mr. Dugald Stewart as ingenuous and infantine in its simplicity, Locke returned the following answer, which, as the same author justly remarks, “ is written with the magnanimity of a philosopher, and with the good-

¹ The system of Hobbes was at this time very prevalent. According to Dr. Bentley, ‘ the taverns and coffee-houses, nay, Westminster Hall, and the very churches, were full of it ;’ and he was convinced, from personal observation, that “ not one English infidel in a hundred was other than a Hobbist.”—Monk’s *Life of Bentley*, p. 31.

humoured forbearance of a man of the world, breathing throughout so tender and unaffected a veneration for the good as well as great qualities of the excellent person to whom it is addressed, as demonstrates at once the conscious integrity of the writer, and the superiority of his mind to little passions." ¹

“ OATES, *Oct. 5th, 1693.*

“ SIR,—I have been, ever since I first knew you, so entirely and sincerely your friend, and thought you so much mine, that I could not have believed what you tell me of yourself, had I had it from anybody else. And, though I cannot but be mightily troubled that you should have had so many wrong and unjust thoughts of me, yet next to the return of good offices, such as from a sincere good will I have ever done you, I receive your acknowledgment of the contrary as the kindest thing you have done me, since it gives me hopes I have not lost a friend I so much valued. After what your letter expresses, I shall not need to say anything to justify myself to you. I shall always think your own reflection on my carriage, both to you and all mankind, will sufficiently do that. Instead of that, give me leave to assure you that I am more ready to forgive you than you can be to desire it ; and I do it so freely and fully, that I wish for nothing more than the opportunity to convince you that I truly love and esteem you, and that I have the same good will for you as if nothing of this had happened. To confirm this to you more fully, I should be glad to meet you

Newton and Locke occasionally corresponded on theological subjects. In the autumn of 1702, Newton visited Locke at Oates, and having read his *Essay on the Corinthians*, he promised to give him his observations and opinion upon it after a more careful perusal. Locke accordingly sent it to him before Christmas 1702 ; but in consequence of receiving no answer, he wrote to him again on the 30th April 1703, and received his observations in a letter dated May 15, 1703, published by Lord King. In this letter Newton tells him that he had purposed to pay him a visit at Oates, on his way to Cambridge in summer, but was “ now uncertain of this journey.” We believe they never met again. Locke died on the 28th October 1704, in the seventy-third year of his age ; and it has been stated that Newton visited his tomb at High Laver, in Essex, in all probability when he paid his next visit to Cambridge.

anywhere, and the rather, because the conclusion of your letter makes me apprehend it would not be wholly useless to you. But whether you think it fit or not, I leave wholly to you. I shall always be ready to serve you to my utmost, in any way you shall like, and shall only need your commands or permission to do it.

“My book is going to press for a second edition; and, though I can answer for the design with which I write it, yet, since you have so opportunely given me notice of what you have said of it, I should take it as a favour if you would point out to me the places that gave occasion to that censure, that, by explaining myself better, I may avoid being mistaken by others, or unawares doing the least prejudice to truth or virtue. I am sure you are so much a friend to them both, that, were you none to me, I could expect this from you. But I cannot doubt but you would do a great deal more than this for my sake, who, after all, have all the concern of a friend for you, wish you extremely well, and am, without compliment, &c.”¹

To this letter Newton made the following reply:—

“SIR,—The last winter, by sleeping too often by my fire, I got an ill habit of sleeping; and a distemper, which this summer has been epidemical, put me farther out of order, so that when I wrote to you I had not slept an hour a night for a fortnight together, and for five days together not a wink. I remember I wrote to you, but what I said of your book I remember not. If you please to send me a transcript of that passage, I will give you an account of it if I can.—I am your most humble servant,

“IS. NEWTON.

“CAMBRIDGE, Oct. 15th, 1693.”

Although the first of these letters evinces the existence of a nervous irritability which could not fail to arise from want of

¹ “The draft of this letter is indorsed J. L. to I. Newton.” I have not found the original among Newton’s papers.

appetite and of rest, yet it is obvious that its author was in the full possession of his mental powers. The answer of Mr. Locke, indeed, is written upon the supposition that Newton was then qualified to point out the objectionable passages in his book, that they might be corrected and better explained; and it deserves to be remarked, that Mr. Dugald Stewart, who first published a portion of these letters, never imagined that Newton was labouring under any mental alienation.

In the autumn of 1693, when Newton was suffering most severely from want of appetite and sleep, we find him deeply engaged in biblical research—collating ancient manuscripts of the New Testament—criticising the manuscript works of Dr. John Mill of Edmund Hall, Oxford, and communicating to him the results of his labours. Only two letters of this correspondence have been found, the letter from Dr. Mill to Newton, requesting the return of his manuscript with his observations, and Newton's reply, showing how busily he had been occupied in the task assigned to him by his friend.¹

Among the other evidences of Newton's consistency of mind, in May 1694, when he is said to have been only beginning to understand the *Principia*, we may mention the visit paid to him in the beginning of that month by David Gregory, who went to Cambridge for the purpose of "consulting the divine author of the *Principia*" on certain errors which appeared to have crept into that work.² On the 7th of the same month, probably when Gregory was at Cambridge, we find Newton

¹ The letter of Dr. Mill, dated Nov. 7, 1693, I found among Newton's papers. That of Newton, dated Jan. 29, 1693, is preserved in the library of Queen's College, Oxford, and is No. 26 of the printed Catalogue. Having been kindly favoured with a copy of this letter by Dr. Fox, I have given both of them in the APPENDIX, No. X., as they possess a peculiar interest.

² "Quoniam variis erroribus in propositionibus 37 et 38 (Lib. 2) irrepsere, illos omnes restitutos hic apponam, prout in auctoris exemplari inveni, incunte Maio 1694, dum Cantabrigiæ hærerem, consulendi divini auctoris gratia."—MS. of David Gregory, Rigaud, *Hist. Essay*, p. 100. Mr. Rigaud adds, that this is "the place in which Fatio says he convinced Newton of his mistakes." See *Edinburgh Transactions*, 1829, vol. xii. p. 71.

denouncing the imposture of the haunted house, and scolding the Fellows of Trinity and several of the scholars for their credulity.¹

The erroneous opinion that Newton devoted his attention to theology only in the latter part of his life, may be considered as deriving some countenance from the fact, that the celebrated general scholium, at the end of the second edition of the *Principia*, published in 1713, did not appear in the first edition of that work. This argument has been ably controverted by the late Dr. J. C. Gregory of Edinburgh, on the authority of a manuscript of Newton, which seems to have been transmitted to his ancestor, Dr. David Gregory, between the years 1687 and 1698. This manuscript, which consists of twelve folio pages in Newton's handwriting, contains, in the form of additions, and scholia to some propositions in the third book of the *Principia*, an account of the opinions of the ancient philosophers on gravitation and motion, and on natural theology, with various quotations from their works. Attached to this manuscript are three very curious paragraphs. The two first appear to have been the original draught of the general scholium already referred to ; and the third relates to the subject of an ethereal medium, respecting which he maintains an opinion diametrically opposite to that which he afterwards published at the end of his *Optics*.² The first paragraph expresses nearly

¹ The following account of this affair is given by Mr. Edleston from De la Pryme's Diary:—"On [the] Monday [night] likewise, there being a great number of people at the door [of the haunted house,—it was a house opposite St. John's College, in the occupation of Valentine Austin], there chanced to come by Mr. Newton, Fellow of Trinity College, a very learned man, and perceiving our Fellows to have gone in [three Fellows of St. John's, with a Fellow Commoner of that College, had rushed in armed with pistols], and seeing several scholars abt' y^e door, 'Oh ye fools!' says he, 'will ye never have any wit? know ye not that all such things are mere cheats and impostures? fie, fie! go home for shame,' and so he left them, scorning to go in." In this Diary, to which we have already referred, there is a full account of the "spirit," which the writer of the Diary had received in a letter from Cambridge.—Edleston's *Correspondence, &c.*, p. lxiv.

² Dr. Gregory concludes his account of this manuscript, which he kindly lent me, in the following words:—"I do not know whether it is true, as stated by Huygens, 'New-

the same idea as some sentences in the scholium beginning "Deus summus est ens æternum, infinitum, absolute perfectum;"¹ and it is remarkable that the second paragraph is found only in the third edition of the *Principia*, which appeared in 1726, the year before Newton's death.

In reviewing the details which we have now given respecting the health and occupations of Newton from the beginning of 1692 to 1694, it is impossible to draw any other conclusion than that he possessed a sound mind, and was perfectly capable of carrying on his mathematical, his physical, and his theological inquiries. His friend and admirer, Mr. Pepys, residing within fifty miles of Cambridge, had never heard of his being attacked with any illness till he inferred it from the letter to himself written in September 1693. Mr. Millington, who lived in the same University, had been equally unacquainted with any such attack, and, after a personal interview with Newton, for the express purpose of ascertaining the state of his health, he assures Mr. Pepys, "that he is very well; *that he fears he is under some small degree of melancholy*, but that there is no reason to suspect that it hath at all touched his understanding."

During this period of bodily indisposition, his mind, though in a state of nervous irritability, and disturbed by want of rest, was capable of putting forth its highest powers. At the request

tonum incidisse in Phrenitim; but I think every gentleman who examines this manuscript will be of opinion that he must have thoroughly recovered from his phrenitis before he wrote either the Commentary on the Opinions of the Ancients, or the Sketch of his own Theological and Philosophical Opinions which it contains." An account of this manuscript, by Dr. J. Gregory, has been published in the *Edinburgh Transactions* for 1829, vol. xii. pp. 64-67.—See Rigaud's *Hist. Essay*, p. 99.

¹This paragraph is as follows:—"Deum esse ens summe perfectum concedunt omnes. Entis autem summe perfecti Idea est ut sit substantia una, simplex, indivisibilis, viva et vivifica, ubique semper necessario existens, summe intelligens omnia, libere volens bona, voluntate efficiens possibilia, effectibus nobilioribus similitudinem propriam quantum fieri potest communicans, omnia in se continens tanquam eorum principium et locus, omnia per presentiam substantialem cernens et regens, et cum rebus omnibus, secundum leges accuratas ut naturæ totius fundamentum et causa constanter co-operans, nisi ubi aliter agere bonum est."

of Dr. Wallis he drew up examples of one of his propositions on the quadrature of curves in second fluxions. He composed, at the desire of Dr. Bentley, his profound and beautiful letters on the existence of the Deity. He was requested by Locke to reconsider his opinions on the subject of innate ideas. Dr. Mill engaged him in profound biblical researches, and we shall presently find him grappling with the difficulties of the lunar theory.

But with all these proofs of a vigorous mind, a diminution of his mental powers has been rashly inferred from the cessation of his great discoveries, and from his unwillingness to enter upon new investigations. The facts, however, here assumed, are as incorrect as the inference which is drawn from them. The ambition of fame is a youthful passion, which is softened, if not subdued, by age. Success diminishes its ardour, and early pre-eminence often extinguishes it. Before the middle period of his life Newton was invested with all the insignia of immortality ; but endowed with a native humility of mind, and animated with those hopes which teach us to form a humble estimate of human greatness, he was satisfied with the laurels which he had won, and he sought only to perfect and complete his labours. Although his mind was principally bent on the improvement of the *Principia*, yet he occasionally diverged into new fields of scientific research—he created, as we shall see, his fine theory of astronomical refractions—he made great improvements on the lunar theory—he solved difficult problems, which had been proposed to try his strength,—he wrote a profound letter to Leibnitz,—he made valuable additions to his “*Opticks*,”—he continued his chemical experiments,—and he devoted much of his time to profound inquiries in chronology and theological literature.

The powers of his mind were therefore in full requisition ; and, when we consider that he was called to the discharge of high official functions which forced him into public life, and compelled him to direct his genius into new channels, we can

scarcely be surprised that he ceased to produce any very original works on abstract science. In the direction of the affairs of the Mint, and of the Royal Society, to which we shall now follow him, he found ample occupation for his time ; while the leisure of his declining years was devoted to those exalted studies in which philosophy yields to the supremacy of faith, and hope administers to the aspirations of genius.¹

¹ Some light has been recently thrown on the illness of Newton by Dr. Dowson of Whitby, who, at a meeting of the Philosophical Society there, on the 3d of January 1856, read a paper "On the supposed Insanity of Sir Isaac Newton," in which he has shown that the malady with which he was afflicted in September 1693 was probably Influenza or Epidemic Catarrhal Fever, which prevailed in England, Ireland, France, Holland, and Flanders in the four last months of 1693. This distemper, which lasted from eight or ten days to a month, was so general, that "few or none escaped from it;" and it is therefore probable, as Dr. Dowson believes, that Newton's mental disorder was merely the delirium which frequently accompanies a severe attack of Influenza. See Dr. Theophilus Thomson's *Annals of Influenza or Epidemic Catarrh in Great Britain*, published in 1852 by the Sydenham Society. See also the *Philosophical Transactions* for 1694, vol. xviii. pp. 105-115.

CHAPTER XVIII.

Newton occupied with the Lunar Theory—His Correspondence with Flamsteed, the Astronomer-Royal—Newton's Letters to Flamsteed, published by Mr. Baily—Controversy which they occasioned—Flamsteed's Letters to Newton discovered recently—Character of Flamsteed, in reference to this Controversy—Of Newton, and of Halley—All of them engaged, with different objects, in studying the Lunar Theory—Newton applies to Flamsteed for Observations on the Moon, and on the Refraction of the Atmosphere, which Flamsteed transmits to him—Analysis of their Correspondence—Flamsteed's bitterness against Halley—Differences between Newton and Flamsteed—Flamsteed's ill health interferes with his supplying Newton with Observations—Newton's impatience and expostulation with Flamsteed—Justification of Flamsteed—Biot ascribes Newton's Letter to Mental Illness—Refutation of this view of the subject—Newton never afflicted with any mental disorder.

WHILE Newton was supposed to be incapable of understanding his *Principia*, we find him occupied with the difficult and profound subject of the lunar irregularities. He had resumed this inquiry in 1692,¹ and it was probably from the intense application of his mental powers which that subject demanded, that he was deprived of his appetite and sleep during that and the subsequent year. When Mr. Machin long afterwards was complimenting him upon his successful treatment of it, Sir Isaac told him that his head had never ached but when he was studying that subject; and Dr. Halley told Conduitt that he often pressed him to complete his theory of the moon, and that he always replied that it made his head ache, and *kept him awake so often, that he would think of it no more*. On a future occasion, however, he stated to Conduitt, that if he lived till Halley made six years' observations, "he would have another stroke at the moon."²

¹ Rigaud, *Hist. Essay*, p. 104.

² Conduitt's *Manuscript notes*.

In order to verify the equations which he had deduced from the theory of gravity, accurate observations on the moon were required ; and, for the purpose of obtaining them, Newton had arranged, in the month of July 1691, to pay a visit to Flamsteed at the Royal Observatory of Greenwich. Learning, however, that Flamsteed was at that time from home, he postponed his visit, and intimated what had been his intention, in a letter of introduction which David Gregory delivered to the Astronomer-Royal in August 1691.¹ During this visit Gregory introduced the subject of the lunar irregularities, and, in a letter to Newton, gives him an account of the conversation which arose on this and other subjects. "Flamsteed," he says, "remembered you very kindly ;" and, among other things, he said "that he did not believe the irregularity of the moon's motions in summer and winter is of that quantity your system would make it."² In the letter delivered by Gregory, Newton had advised Flamsteed to publish a catalogue of the correct places of such fixed stars of the first six magnitudes, as had been observed by others, and afterwards, by way of an appendix, those observed by himself alone,—an advice which, from causes perhaps not then known to Newton, struck a discordant key in the mind of Flamsteed. He believed that this advice was suggested by Halley, whom he considered as an enemy, who had misrepresented him to his friends as unwilling to print his observations. He enters, therefore, in a long letter,³ into an explanation of his reasons for not printing his observations, and he concludes the letter with the severest animadversions upon Halley, which it is impossible to justify. "I have no esteem," he says, "of a man who has lost his reputation, both for skill, candour, and ingenuity, by silly tricks, ingratitude, and foolish prate ; and that I value not all, or any of the shame of him and his infidel companions ; being very well satisfied, that if

¹ Dated 10th August 1691, published in Baily's *Flamsteed*, p. 129.

² August 27, 1691, unpublished.

³ February 24, 1692. Baily's *Flamsteed*, pp. 129-133.

Christ and his Apostles were to walk again upon the earth, they should not escape free from the calumnies of their venomous tongues. But I hate his ill manners, not the man. Were he either honest or but civil, there is none in whose company I could rather desire to be." Newton's reply to this letter, if he did reply, has not been found either among his own papers or those of Flamsteed.

Newton seems to have had no farther communication with Flamsteed till 1694,¹ when a correspondence took place between them, which was continued with little intermission for nearly two years, and with the nature of which the public was not till lately acquainted. The late Mr. Francis Baily having obtained access to the manuscripts of Flamsteed, in the possession of a private individual, and to other manuscripts and books of his which had been left in the Royal Observatory, found that they contained materials which he considered of inestimable value in the history of astronomy, and through the influence of the Duke of Sussex, the Lords Commissioners of the Admiralty were induced to print them at the public expense.²

The general effect of this publication, and of the sentiments expressed by Mr. Baily, was injurious to the memory of Newton; and as the work excited a high degree of interest in every part of the globe where science was cultivated, the friends of the injured philosopher were roused in his defence, and the

¹ In sending a copy of an unpublished letter on Earthquakes to a mutual friend, dated April 10, 1693, Flamsteed says, "Give my humble service to Mr. Newton, and let him know I owe him another concerning the present state of my labours, which I shall not fail to pay him now in a short time. It may satisfy him, that they go on successfully, and tend towards what they were designed for. I have thirty maps of the constellations drawn, having observed 2200 fixed stars visible by the naked eye, and having about as many left to observe, as will make them above 3000, which is above double the old catalogues."

This work, with a preface and note by the editor, is entitled *An Account of the Rev. John Flamsteed, the first Astronomer-Royal, compiled from his own MSS., and other authentic Documents, never before published; to which is added, his British Catalogue of Stars.* By Francis Baily, Esq.: Lond. 1835. 4to. Pp. 671. A Supplement appeared in January 1837, in reply to criticisms by the friends of Newton.

scientific world is still divided on the subject. In justifying himself for publishing certain parts of the correspondence, Mr. Baily remarks, "that the personal motives for withholding them have long passed away, and now ceased to exist; and however unpleasant and painful it must be to an enlightened mind to find such eminent characters as Newton and Halley mixed up with subjects of the kind to which I shall presently allude, and pursuing a line of conduct towards Flamsteed which tends to make them appear less amiable in our eyes, yet a proper regard for truth and justice prevents any suppressions at the present day of the many curious and important (though often at the same time lamentable) facts which these manuscripts have, for the first time, brought to light. I have indeed," he continues, "in justice to the parties here alluded to, endeavoured to procure information of a contrary tendency from various sources, and sought for documents which might tend either to extenuate or explain the conduct of Newton and Halley in these proceedings, or to throw new light on the origin and nature of the quarrel that at a certain period of this history existed between Flamsteed and his two distinguished contemporaries, but, notwithstanding all my researches, I regret that it has been hitherto without success."¹

In enumerating the repositories to which his researches extended in quest of information favourable to Newton and Halley, Mr. Baily mentions "the valuable collection of Newton's MSS. belonging to the Earl of Portsmouth," and states that he "found nothing in it to throw any light on the special object of his inquiries." From causes which I cannot explain, Mr. Baily had not lighted upon the letters of Flamsteed to Newton, which had been carefully preserved, and of which I have now before me nearly *forty*, which complete the correspondence² between these two distinguished individuals, and enable us to

¹ Baily's *Flamsteed*, pref., pp. xix. xx.

² Mr. Baily was able to publish only *eleven* of Flamsteed's letters to Newton, and these not correct copies of the originals.

form a more correct judgment on those delicate questions to which this controversy has given rise. Before proceeding, however, to give a general account of its history, the reader requires to have some knowledge of the position and character of the three distinguished men whose reputation is so deeply at stake.

Flamsteed, who was four years younger than Newton, held the high position of Astronomer-Royal, along with the small living of Burstow, in Surrey. His salary was only £100 a year, and he was allowed nothing from Government, either to provide or repair instruments, or to pay the expenses of a computer for reducing his observations. He was, therefore, obliged to purchase, or to construct with his own hands, the instruments which he used, and to pay the expenses of a servant capable of making the calculations which he required. His observations, consequently, were his own property, and no private individual was entitled to demand them. Flamsteed was, from his infancy, a person with a feeble constitution, and, when Astronomer-Royal, was afflicted with severe headaches, and with the stone and other painful distempers; but he bore these with Christian resignation, and never failed to exhibit in his conduct, and to express in his writings, the humblest submission to the Divine will. But with all his piety and virtues, there was a defect of character which it is necessary to state. He was prone to take an unfavourable view of the motives, as well as the conduct of those with whom he differed; and when such impressions were once made upon his mind, it was almost impossible to dislodge them. The following anecdote from the autobiography of William Molyneux, Esq., the friend of Locke, gives a view of Flamsteed, which is in every respect consistent with that which he displayed in his controversy with Newton and Halley:—
“Mr. John Flamsteed, the King’s astronomer at Greenwich, was formerly my constant correspondent for many years,¹ but

¹ Eighteen letters from William Molyneux to Flamsteed, written in the most affectionate terms, and dated between September 17, 1681, and May 17, 1690, inclusive, were published in the *General Dictionary*, Art. MOLYNEUX, vol. vii. p. 613.

upon publication of my *Dioptrics*, he took such offence at my placing a solution of his, of the 16, 17, and 18 propositions thereof, after, and not before, the solution I myself gave of the said propositions,¹ that he broke his friendship with me, and that, too, with so much inveteracy, that I could never bring him to a reconciliation, though I have often endeavoured it, so that at last I slighted the friendship of a man of so much ill nature and irreligion, how ingenious and learned soever."²

Mr. Newton was at this time Fellow of Trinity College, and Lucasian Professor at Cambridge, and though his *Principia* had been for six or seven years before the public, its value was known but to a few, and his great talents not sufficiently appreciated. He had been long acquainted with Flamsteed, and, in a correspondence which he had with him about the comet of 1680, Flamsteed had considered him as "magisterially ridiculing an unanswerable opinion of his," which turned out to be true.³ In Newton's controversies with Hooke,⁴ too, we have noticed some traces of personal feeling which might have been spared; but it is in his relations with Locke that some of those little imperfections of character are seen which slightly reappear in his communications with Flamsteed. We do not refer to the opinions which he expressed when under a nervous irritation, but to those occurrences which induced Locke, in 1703, to state confidentially to his cousin, Lord Chancellor King, "that Newton was a nice man to deal with, and a little too apt to raise in himself suspicions where there is no ground."⁵

Dr. Edmund Halley, who was twelve years younger than Flamsteed, was resident in London, and clerk and assistant secretary to the Royal Society during the correspondence between Newton and Flamsteed. He was a man of the world, and

¹ These propositions are referred to in his letter to Flamsteed, May 7, 1690.

much esteemed in society, but was generally supposed to entertain infidel opinions. Under this impression, Bishop Stillingfleet refused to recommend him to the Savilian Chair of Geometry in Oxford, when he was a candidate along with David Gregory ; and Bishop Berkeley, on very imperfect information, rashly ventured to dedicate the Analyst to him as an "infidel mathematician." "Mr. Addison, as has been stated,¹ "had given Bishop Berkeley an account of their common friend Dr. Garth's behaviour in his last illness, which was equally displeasing to both these advocates of revealed religion. For when Mr. Addison went to see the Doctor, and began to discourse with him seriously about preparing for his approaching dissolution, the other made answer, 'Surely, Addison, I have a good reason not to believe these trifles, since my friend Dr. Halley, who has dealt so much in demonstration, has assured me that the doctrines of Christianity are incomprehensible, and the religion itself an imposture.'" Flamsteed never scrupled to denounce Halley as a libertine and an infidel ; and we regret to see that a modern writer has ventured to say that Halley was low and loose in his moral conduct, and an avowed and shameless infidel.² Had such been his character, he never would have been the friend and companion of Newton. It is quite true that Halley was sometimes checked by Newton when he had said anything that appeared disrespectful to religion, by the mild reproof, "I have studied these things—you have not ;" and I have found a memorandum signed by Mrs. Conduitt, in which she says that Newton "could not bear to hear any one talk ludicrously of religion, and that he was often angry with Dr. Halley on that score, and lessened his affection for Bentley." Thus placed in the same category with Dr. Bentley, we have no doubt that Halley's speaking ludicrously of religion amounted to nothing more than his maintaining cer-

tain opinions about the existence of a pre-Adamite earth, and ridiculing vulgar errors which have been too frequently associated with religious truth.¹

These three eminent individuals were, in the years 1694 and 1695, engaged in nearly the same researches. They were all intently studying the irregularities of the moon's orbit,² and had Halley not been a party, there is reason to believe that no difference would have arisen between Newton and Flamsteed. We have failed, like Mr. Baily, to discover the ground of Flamsteed's virulent antipathy to Halley, evincing a degree of hatred which no Christian could rightly cherish, and which no honourable man could avow, and still less record. The charge of infidelity and libertinism was, we fear, but the mask under which personal feelings were too readily expressed; and if David Gregory's memorandum of him be true, we have a satisfactory explanation of the origin of Flamsteed's enmity to Halley, in what Mr. Rigaud calls "his detected act of dishonesty." "Newton," says Gregory, "often told me, but especially in December 1698, that these tables (Flamsteed's lunar ones) were first made and computed by Edmund Halley, and communicated to Flamsteed, and published by him without the knowledge of Halley, and that this theft was the origin of the eternal quarrels between Halley and Flamsteed. Newton said that he had seen the handwriting of Halley."³

Under these circumstances, Newton and Halley were desirous

¹ We recommend to the reader the able *Defence of Halley against the Charge of Religious Infidelity*, by the Rev. S. J. RIGAUD, M.A., of Ipswich, Oxford, 1844. Professor Rigaud, the author's distinguished father, a man of genuine piety, entertained the same opinion of Halley.

² We owe to Halley the discovery of the secular equation of the moon.

³ "The following curious memorandum," says Mr. Rigaud, "is written by Dr. Gregory in the margin of his annotations on the *Principia*, p. 162. The subject to which he has annexed it, is the mention of Flamsteed's lunar tables, derived from the hypothesis of Horrox (Schol. p. 462, first edit. of *Principia*), 'Newtonus mihi saepe dixit, nominatim Decembri 1698, Londini, tabulas hasce fuisse ab Ed. Halleio primum factas et supputatas, et cum Joh. Flamstedio communicatas, et ab illo, *inscio* Halleio, editas, et propter hoc factum æternas natas esse inter Halleium et Flamstedium rixas. Newtonus dixit se vidisse autographum Halleii.'"—*Defence of Halley*, p. 20.

of receiving from Flamsteed his observations on the moon,— observations of such value, that without them they could not proceed in their researches, and of such rarity that they could not obtain them from any other observatory in the world. In order to procure the observations which he required, Newton paid a visit to the Royal Observatory on the 1st of September 1694. Flamsteed showed him 150 places of the moon calculated from his own observations, either by himself or “his hired servants,” with the differences, in three synopses, between these places and those in the common tables of the moon, “in order to correct the theory of her motions.” These observations were given to Newton on two conditions, which he accepted, 1st, That he would not, without Flamsteed’s consent, communicate them to anybody; and 2dly, That he would not, in the first instance, impart the result of what he derived from them to anybody but himself.¹

¹ Flamsteed, who makes this statement in his autobiography, concludes it by saying, “All this he (Newton) approved, and by a letter of his dated confessed. Nevertheless he imparted what he derived from them both to Dr. Gregory and Dr. Halley, *contra datam fidem*. The first of these conditions I believe he kept. The latter he *has forgot* or broke.”

In defence of Newton, we may state, that in a few days after Flamsteed exacted the *first* of these conditions, he not only showed the same observations to Halley, but suffered him to take notes of part of them. With regard to the *second* condition, which he is said to have broken, we shall presently see, from an unpublished letter of Flamsteed, that he asks Newton certain questions about the moon’s theory, and that Newton imparted to him his remarkable equation of the menstrual parallax. We shall find also that he imparted to him, *in return for his observations*, his theory and table of refractions, one of the finest productions of his genius, and of essential value to Flamsteed in the reduction of his observations, and subsequently his valuable tables of the moon’s parallax, and the equations of the moon’s apogee and the eccentricity of her orbit. It appears, too, from a letter of Newton of the 17th November 1694, that he asks Flamsteed to have but a little patience, and he will be the first man to whom it will be imparted, *when the theory is fit to be communicated without danger of error*. In consequence of the delay in getting Flamsteed’s observations, he was not able to proceed any farther with the lunar theory, and his appointment to the Mint necessarily interfered with his scientific researches. His connexion with Flamsteed had ceased for many years, and therefore the brief notice of the lunar theory which he communicated to Gregory in June 1702, could not be considered as a breach of the condition under which Flamsteed brought him.

That the reader may be sufficiently aware of the rash charges which Flamsteed never

In a few days after this visit, Flamsteed addressed a letter¹ to him acknowledging the return of the two synopses of the moon's places, offering him more when he signifies his having occasion for them, and informing him that he "intends hereafter to cause his man to calculate them both from the observations and tables as soon as observed, whereby it will be soon evident whether the heavens will allow these new equations you introduce, and if they will, how they are to be limited." During his visit to the observatory, Newton must have expressed a wish for observations to test his theory of atmospheric refractions, for Flamsteed mentions that he has set himself to inquire what refractions can be got from his observations, and promises that whatever he gathers from them shall be freely imparted to him. "I shall never," he says, "refuse to impart either the observations themselves, or my deductions from them, to any person that will receive them with the same candour as you do. If I desire to have them withheld from others who make it their business to pick faults in them, and censure them, and asperse me no less unjustly than ungratefully, you will not blame me for so doing. When H. (Halley) shows himself as candid as other men, I shall be as free to him as I was the first seven years of our acquaintance, when I re-

scrupled to make against those who displeased him, we quote the following example contained in his own letters, which Mr. Rigaud has observed:—"In 1705, Abraham Sharpe communicated to the Royal Society his quadrature of the circle; and Flamsteed writes him an account in which Halley is accused of acting most unfairly, and with a view to his own credit, about printing the papers. This was on the 20th August, and on the 11th of the following month, Flamsteed found himself obliged to retract what he said on the subject, and yet in April 1715 he had forgotten everything but what accorded with his hostile feeling, and writes to the very same man to say, 'you remember how he served you about the quadrature of the circle; after such usage, you ought to be very cautious how you treat him.'"—*Defence of Halley*, pp. 20, 21, and Baily's *Flamsteed*, pp. 244, 246, and 313.

¹ Newton seems to have been unwell at the time of his visit to Greenwich, for Flamsteed begins this unpublished letter, dated September 7, 1694, with the intimation that he had sent him a receipt which Mr. Stanhope's sister makes use of with good effect, and wished he might find the same benefit from it. In his reply, Newton "thanks him heartily for the receipt."

fused him nothing that he desired. I am told by a friend of his that he is very busy calculating the moon's places on a sudden. Perhaps some hints he has got from you have set him to work anew, but except you have been as plain with him as you were with me, I am satisfied he will never be able to find out the parallactic equation,¹ nor limit it without a bigger store of observations than he is possessed of, though he have many of mine made between 1675 and 1682.

"Since you went home, I examined the observations I employed for determining the greatest equations of the earth's orbit, and considering the moon's places at the times of . . . , I find that (if, as you intimate, the earth inclines on that side the moon then is) you may abate ab^t 20" from it, say y^t it may be only 1° 56' 00"."

Flamsteed concludes this curious letter, the first of the series, with a request that Newton would acquaint him how the observations agree with his conception, and with an offer of more observations upon due notice.

To this letter² Newton returned an answer which must have been very agreeable to Flamsteed. After comparing the observations with his "conception," he was satisfied that by both together the moon's theory might be reduced to the exactness of 2 or 3 minutes, and that he believed he would be able to set it right this winter. For this purpose, however, he requested certain observations which he specified.

In a few days Flamsteed replied in a long letter of October 11, 1694, in which he mentions that Halley had applied for a sight of the lunar observations, and that he had come to Greenwich and taken notes from the synopses of the moon's places, which Newton had received,—an act of kindness which Flamsteed did not grant without "minding him of his disingenuous behaviour in several particulars."³

¹ The coefficient for this equation is the Sine of the sun's parallax divided by that of the moon's.

² Dated October 7, 1694.

³ The original of this letter differs from that published by Mr. Baily in two points.

For the table of refractions near the horizon, Newton was particularly thankful.¹ He ascribed the differences of refraction at the same altitude to the different temperatures of the air, and suggested that Flamsteed should in all his observations note the state of the barometer and thermometer. He told him that he had dined with Halley, and had much discourse with him about the moon; that Halley had asked for a sight of the observations which made the parallactic equation between 8' and 10', but that he had refused on account of the engagement to communicate them to nobody without his consent. "I am glad," he adds, "that there is like to be a new correspondence between you, and hope it will end in friendship."

Flamsteed, in his reply,² is delighted to hear of the agreement between his observations and the theory. He offers to recalculate any of the observations that may appear incorrect, and promises a new synopsis of the moon's places, along with one of all the observations from which he drew the small empirical table of the refractions. "Yesterday at London," he says, "I had a great deal of talk with Mr. Halley about the moon's motion. He affirmed the moon's motion to have been swifter in the time of Albategni than at present, and that the cause of it was by reason that the bulk of the planets continually increased. I gave him the hearing, and at last told him that his notion was yours, he answered 'in truth you helpt him with that.'³ He affirms farther, that the moon's apogee moves swifter in winter than in summer, and that the greatest equations of it are biggest when the sun is in perigee. That they are as big as Copernicus makes them, that is 13° 9'.

The "empirical small table of the differences of refraction of the sun and Venus in height" has been omitted in the published copy, and also the following postscript. "Mr. Halley is busy about the moon, has promised me his corrections, intends to print something about her system ere long, and affirms the moon's motion different in the times of Albategni from what it is now." I have given this table in the APPENDIX, No. XI., in order to justify the references to it in the letters of October 11 and 24, 1694.

¹ October 24, 1694.

² October 25, 1694, unpublished.

³ See *Principia*, 2d Edit. p. 481.

This smells too, of your theories. I remember that you affirm all the equations biggest when the earth is nearest the sun. I should be glad to hear that you had found in what proportion the equations of the apogee and the eccentricity alter, and what are their greatest differences in the last, the quantity of the first, how the variations alter, and that you would please to impart it to me, that so hereafter I may calculate on sure grounds, and compare not an apparently erroneous, but a true theory with my observations, whereby its faults may be corrected."

In Newton's reply of the 1st November, he answers Flamsteed's questions, and explains to him the menstrual parallax of the sun, which he estimates at 16" or 20", an equation depending on the ratio of the masses of the earth and moon, and which, as M. Biot remarks, is one of the most delicate corrections in our modern tables, amounting only to 8".

"Perceiving¹ that Newton was as yet only trying how his observations would consist with y^e emendations, and that he had not as yet limited them to his mind," Flamsteed would not urge him any farther for them, but trusts that when he has "determined what corrections or additions are to be made to that theory which it was his good fortune to meet with, and usher into the world, he doubts not but you will impart them as freely as he did the observations, where you limit or confirm them, to you."²

On the 17th November, Newton sends to Flamsteed his table of refractions, computed by applying a certain theorem to his observations; and he explains to him his plan of first obtaining a general notion of the lunar equations to be determined, and then by accurate observations to determine them, seeing "that there is a complication of small equations, which can never be determined till one sees the way of distinguishing

¹ November 3, 1694, unpublished.

² In this letter Flamsteed says, that the parallactic equation does not exceed a single vibration of the pendulum, and cannot be determined by the largest instruments.

them, and attributing to each their proper phenomena." He asks Flamsteed to have a little patience with him till he has brought the theory he ushered into the world to competent perfection, fit to be communicated to him; and he promises "to gratify him to his satisfaction for the trouble he is at in this business."

In replying to this letter, Flamsteed¹ says that "he was

¹ This letter of Flamsteed's, as published by Mr. Baily, differs entirely from the letter actually sent to Newton, and must have been a scroll, which he greatly altered and enlarged. *We cannot, therefore, place confidence in the abstracts of his letters to Newton, as printed by Mr. Baily.* The date of the letter is December 16th, not the 6th. In the original copy of this letter, and also in the scroll, Flamsteed introduces a new charge against Halley in the following words:—"I desired you in my last to let me know if you had not been presented some years ago with a geometrical tract of Viviani's, in quarto, Latin. You have given me no answer. Pray, be free with me, and let me have one, it will much oblige." In his letter of the 27th, he had said,— "I desire you to let me know whether Mr. Halley did not, five or six years ago, present you with a geometrical piece of Viviani's in quarto?" Newton made no reply to these requests. On the 31st December, Flamsteed thus recurs to the subject:—"I must beg your pardon for having urged you twice about Viviani's book. I shall tell you the occasion, and give you no further trouble. Mr. Rook being in Italy, received one of them directed to me by the author's own hand, which he sent to E. H. (Edmund Halley) with other things, who, I am told, presented it to you; and himself denies not that he sent it you. Now, I am not concerned for the book at all. If you had one from him, keep it either as his gift or mine; but because I have great reason to suspect a book of much greater value, directed to me, has been disposed of for advantage by a friend and acquaintance of his this last summer, and if the first had been brought to light, the latter might have been made evident; but I desire to concern you no farther with it, and therefore shall move you no more, nor expect any answer in this particular, being ever desirous to make my friends as easy as I can." To these applications Newton replied on the 26th Jan. 1694 $\frac{1}{2}$,—"About three or four months before Dr. Gregory was made Professor of Astronomy at Oxford, an Oxford gentleman, a student in mathematics (I think his name was Rook), called on me on his way from London, and showed me a new book published by Viviani. He offered to leave it with me to peruse; whereupon I turned over the leaves, and then returned it to him again, and he took it away with him, I think, to Oxford; and I saw it no more. I forbore to answer your first inquiries about it, because I feared it might tend to widen the breach between you and Mr. Halley, which I would rather reconcile if it were in my power. And now I hope that what I have told you will not be made use of to that purpose, lest it should also do me an injury."—See Baily's *Flamsteed*, pp. 144, 145, 148, 149. "I am very well satisfied," replies Flamsteed on the 29th January, "in what you tell me about Viviani's book; and you may conclude what you are to think of Mr. Halley from this, that he told me before a club of the Society that you had it. I find you understand him not so well as I do. I have had some years' experience of him, and a very fresh instance of his ingenuity, with which I shall not

displeased with him not a little for the offer, and ascribes it to the suggestion of some malicious friend, and assures Newton that he never did, and would scorn to receive money for any such service." Newton makes an apology¹ for the mistake he committed, and requests that Flamsteed will let it pass, and concur with him in the promotion of astronomy; and, in order to appease his friend, he sends him the beautiful theorem by which he computed his table of refractions,—a theorem which M. Biot justly characterizes as giving the true analytical expression of the differential of refraction, such as it is now employed, and which cannot but be regarded as one of the highest efforts of Newton's genius.²

In answering this letter on the 31st December, Flamsteed enlarges on the subject of refractions, and transmits a table of morning and evening refractions observed in June 1678, from 79° to $89^{\circ} 50'$ of zenith distance. He sends him two lunar observations, and explains why he has not sent him others that he had made. Newton informs him in return,³ that the theorem on refractions which he had sent him was defective in making the refractive power of the atmosphere as great at the top as at the bottom, and that he had found another theorem which required consideration. "In the former theorem," he continues, "the areas are to be determined by the fifth lemma of the third book of the *Principia*." He then explains to him how the air being colder and more dense at sunrise, the refractions

trouble you. 'Tis enough that I suffer by him. I would not that my friends should, and therefore shall say no more, but that there needs nothing but that he show himself an honest man to make him and me perfect friends; so that if he were candid, there is nobody living in whose acquaintance I would take more pleasure; but his conversation is such that no modest man can bear it, and no good man but will shun it." The four obnoxious paragraphs in the draught of this letter, at the bottom of p. 150 of *Baily's Flamsteed*, do not exist in the original sent to Newton!

¹ December 20, 1694.

² See Biot's interesting observations on this theorem, and his admirable and elaborate *Analysis of Newton's Tables of Refraction, with an indication of the Numerical Processes by which he computed them in the Journal des Savans*, 1836, pp. 642, 735.

³ January 15, 1695.

are then greater, and how from its being rarer in the evening, the refractive power is diminished. Flamsteed admits, in his reply,¹ that the change of temperature is the principal, but not the sole cause of the alterations in the morning and evening refractions. Sir Jonas Moore told him often, that when he lived in the fens, he often saw "the beasts raised to his sight very much by the fogs that lay betwixt him and them; and he has heard the late King Charles and old sea-captains talking together about the sea-air, and relating how, standing upon Dover beach at high-water, they saw the streets of Calais very plain, but whilst they stood, as the water sunk, these objects sunk and at last disappeared."

Considering a table of refractions as the foundation of astronomy, and very necessary for Flamsteed's great work, Newton² is anxious to present him with one in return for his observations, and, as he has found a new theorem which makes the calculation easy, he hopes, when he has recovered from a slight indisposition, to finish it. "Supposing," he says, "the atmosphere³ to be of such a constitution as is described in the 22d Prop. of my second Book (which certainly is the truth), I have found, that if the horizontal refraction be 34', the refraction in the apparent altitude of 3° will be 13' 3"; and if the refraction in this apparent altitude of 3° be 14', the horizontal refraction will be little more than 37'." On the 15th March, Newton sends him his table of refractions, in which, at 3° of altitude, the refraction is 13' 20", so that the table is the same as that published by Halley in the *Phil. Trans.* for 1721. "Newton," as M. Biot remarks, "is therefore the creator of the theory of astronomical refractions, as he is of that of the theory of gravity. But the first of these titles was hitherto unknown to us; and we can now see, that it is not one of his works which has given him the least trouble, on account of the number, the variety, and the dispersion of the physical elements

¹ January 18, 1695.

² January 26, 1695.

³ February 16, 1695.

which he required to discover, to collect, and to combine in its establishment."¹

In his letter of the 23d April 1695, Newton says, "When I set myself wholly to calculations (as I did for a time last autumn, and again since Christmas, in making the table of refractions), I can endure them, and go through them well enough; but when I am about other things (as at present), I can neither fix to them with patience, nor do them without errors, which makes me let the moon's theory alone at present, with a design to set to it again, and go through it at once. When I have your materials, I reckon it will prove a work of about three or four months; and when I have done it once, I would have done with it for ever."

After writing other two letters, in one of which he expresses his desire to get the naked observations on the R. ascension and meridional altitude of the moon, and have them calculated by "his servant Sir Collins," he addresses Flamsteed in the following manner :²—"After I had helped you where you had stuck in your three great works, that of *the theory of Jupiter's satellites*, that of *your catalogue of the fixed stars*, and that of *calculating the moon's places from observations*, and in all these things freely communicated to you what was perfect in its kinds (so far as I could make it), and *of more value than many observations*, and what (in one of them) contains more than two months' hard labour, which I should never have undertaken but upon your account, and which I told you I undertook that I might have something to return you for the observations you then gave me hopes of, and yet when I had done, saw no *prospect of obtaining them*, or of getting your *synopses rectified*.³ I despaired of compassing the moon's theory, and had thought of giving it over as a thing impracticable, and occasionally told a friend so, who then made me a visit. But now you offer me these observations which you made before the year 1690, I

¹ *Journal des Savans*, November 1836, p. 655.

² July 9, 1695.

³ These passages were underlined by Flamsteed.

thankfully accept of your offer, and will get as many of them computed as are sufficient for my purpose."

We cannot find in the seven unpublished letters which Flamsteed wrote to Newton from February 7th to July 2d, 1695, inclusive, anything to justify this letter. Flamsteed begins his letter of February 7th with a long tirade against Halley, and promises that when they meet he will tell him his history, which is too foul and large for a letter: He mentions two different reports from London of Newton's death, which he was able to contradict: He tells him that his servant, his computer, has run away, and that he is teaching another: He sends him observations on refractions and on the eclipses of the moon in 1678 and 1682, and he complains of a report which, at his request, Newton succeeds in putting down, that Flamsteed refused to impart his observations to him. This request is preferred in the following manner:¹ "You see how willing I am to accommodate you with what is necessary for clearing the motion of the moon, and how small a return I desire,—that is only to know what equations you use at present in the moon, and what limitations you give them. Not that I have any desire or design to meddle with the restitution of her motions myself, but only to satisfy my own curiosity, and not to be ignorant of the use you have made of what you imparted to me, as I told you before. Only I must desire you to acquaint Mr. Bentley (whom I know not), but who, I am told, complains that the second edition of the *Principia* will come out without the moon, because I do not impart my observations to you, that I *shall furnish you to your satisfaction in that particular.*"² Had I heard of it from yourself, I had told you the contents of this letter some days since, and assured you the fault should not be laid to my charge. And he adds in a postscript, "What one friend may justly expect from another, you shall ever command from yours, J. F."

In his very short letter of July 13, 1695, Flamsteed takes

¹ July 2, 1695.

² The *italics* are in the original.

no notice of the attack of Newton. He promises places of the fixed stars and the nonagesimal table, and adds, "A report is industriously spread in town that I have refused to impart any more observations to you. I heard that he who spreads it intends you a visit ere long. I hope you will take notice of his disingenuity in this particular, since 'tis only my violent distemper and your own silence that were the cause of mine. I shall answer yours more fully next week."

On the 18th Flamsteed replies, as might have been expected, to the charge which had been made against him. "I have just cause," says he, "to complain of the style and expression of your last letter. They are not friendly, but that you may know me not to be of that quarrelsome humour I am represented by the Clerk of the Society (Halley), I shall waive all save this expression, *that what you communicated to me was of more value than many observations*. I grant it—as the wire is of more worth than the gold from which it was drawn.¹ I gathered the gold matter, and fined and presented it to you sometimes washed. I hope you value not my pains the less because they became yours so easily. I allow you to value your own as high as you please, and require no other reward for what assistance I sometimes afford you, but that I may now and then see some of the workmanship; and if that be not ready when I desire it, or if you think it not fit to favour me with it, I can easily be contented. Nor do I take it amiss that you often take no notice of some small particulars whereon I have desired to know what you have determined. Since I know very well that in things of their nature it is difficult to determine, and we often change what at first we thought would need no alteration or towards none. I have altered my solar numbers five times, and would not be ashamed to change again if I saw reason for it. If you answer me that you have not

¹ "Machin told me," says Conduitt, "that Flamsteed said 'Sir Isaac worked with the ore he had dug,' to which Sir Isaac replied, 'If he dug the ore, I made the gold ring.'"—*Conduitt's MSS.*

determined whether any other than the usual equations are to be used in the Syzigies, if you are not resolved how the moon's mean motion is to be corrected, you may say it. I shall urge you no farther, and nevertheless whenever you let me know that it lies in my power to serve you, I shall do it freely. But you will not complain of me to others without cause, and thereby add to the affliction I suffer from my obstinate distempers, and the calumnies of disingenuous and impudent people, if you have any value for your friend and humble servant."

This earnest remonstrance is acknowledged by Newton on the 20th of July, the day that he received it. "The report," he says, "was against his mind, and he has written to put a stop to it. . . . Such expostulations or expressions in your last and some other letters, as tend to a difference, I pass by. Pray take care of your health. Dr. Battely (chaplain to Archbishop Sancroft) was much troubled with violent headaches, and found it a certain cure to bind his head strait with a garter till the crown of his head was numbed; for thereby his head was cooled by retarding the circulation of the blood. 'Tis an easy remedy, if your pain be of the same kind."

Flamsteed was gratified with this letter. He thanked Newton¹ for Dr. Battely's remedy, as it "shows your friendly concern for my welfare." "Your letter," he says, "sets all right betwixt us. I have as great a stock of patience, and as good an one as I have of observations, and 'tis all ways drawn out on every occasion to serve my friends. My indisposition hindered me from serving you as I desired. You mistook the reason of my silence. I hope you will have the patience on my account that you demand of me on yours. . . . The next week I am going to my parsonage, but I shall take care to have you furnished with another sheet of observations before. If you would rather have any other than the remains of 1677, let me know it. I shall fit you according to your desires."²

¹ July 23, 1695.

² In this letter, Flamsteed "presents him, before he demands it," with "a nonagesi-

In replying to this letter in the following week,¹ Newton tells Flamsteed "that he had an excuse sent him (from Bentley or Halley) for what was said at London about your not communicating, and that the report should proceed no farther." He is glad all misunderstandings are composed. He thanks him for the nonagesimal table, "which he designed to make himself, as it saves him labour." And he adds, "that as the transcribing of these things gives your servant trouble, and, for encouraging him, I shall order Will. Martin, the Cambridge carrier, to pay him *two guineas if you please to let him call for it, or to pay it to his or your order in London, if you please to let me know where.*"²

Flamsteed was annoyed by this proposal to pay his servant. "I take it very kindly," he says,³ "that you acquainted me with your intent to gratify him for his pains before you did it, but I must entreat you to forbear. He is paid already. A superfluity of moneys, I find, is always injurious to my servants. It makes them run into company, and waste their time idly, or worse. I take care he wants nothing. If you send

mary table" for every degree of right ascension, "as I would not have you want any thing that lies in my power to save you the trouble of calculation;" and he closes his letter thus: "By frequent trials and alterations of his contrivances, Kepler found out the true theory of the planetary motions. You must not be ashamed to own that you follow his example. When the inequalities are found, you will more easily find the reason of them than he could do when but little of the doctrine of gravity was known."

¹ July 27, 1695.

² In the copy of this letter in the British Museum, the words *two shillings* appear here with the following note:—"Mr. Flamsteed altered it so for the word *guineas*, which is in the original, as is evident from the erasure." Professor Rigaud, at Mr. Bally's desire, examined the original letter, and found the words *two guineas if you please to call for it* crossed out with the pen, but no substitution of *shillings* for *guineas*. Mr. Edleston, however, who has examined the original, observes that all the words following "pay him" (in the passage given in the text in *italics*) are crossed out in the manuscript, and the word "guineas" altered into "shillings" apparently by Flamsteed. The words after "for them" to the end of the passage are conjectural, the original writing being most skilfully blotted out. . . . What motive Flamsteed could have had for disguising any part of the above sentence, I do not pretend to divine. It is curious that Mr. Rigaud, who examined the manuscript in reference to this very point, should have overlooked the original "guineas."—Edleston's *Correspondence*, &c., p. lxxviii, note 125.

³ August 4, 1695.

him verbal acknowledgments of his pains, and commendations for his care and fidelity in copying, it will be a reward for him, and encouragement the best you can give him, and further I cannot allow. . . . Pray say nothing to anybody of your proposal."

In another letter on the 6th of August, he says, that during the last six years "he had done more towards the restitution of astronomy than has been done in some ages before;" and, after mentioning what he has accomplished in the nineteen years that he has been at Greenwich, he adds,—“I write this purposely to you, because I know a sparke (Halley) is with you, that complains much I have lived here twenty years and printed nothing. I do not intend to print a St. Helena catalogue, and for that reason I defer the printing of anything thus long, that when I do print it may be perfect, as by the grace of God it shall.”

Newton closes this correspondence with a short letter, dated September 14, in which he intimates that Halley's determination of the orbit of the comet of 1683, by his theory, "answers all your observations and his own to a minute;" that he has just returned from a journey into Lincolnshire, and is going on another; and that "he has not got any time to think of the theory of the moon, or have leisure for it, for a month or above."

Flamsteed answered this letter on the 19th September,¹ complains of his ill health, considers the theory of gravity confirmed by its giving the orbit of the comet conformable to observation, and hopes, by travelling, to have some small share of health left wherewith to serve his friends, "and to supply you with what is wanting to finish the theory of the lunar motions, which I hear you doubt not now but to render very nearly agreeable to the heavens."

Having heard nothing from Newton for four months, Flam-

¹ Not on the 17th, as stated in Baily's *Flamsteed*, p. 160. Flamsteed's notes of his answer to Newton's letter, as usual, misrepresents its contents.

steed writes him on the 11th January 1696, and, after offering him "further observations of the moon," which may be of use to him, he says,—“But if what I hear be true, you will have little need of them, for I have been told, ever since I came out of Surrey, that you have finished the theory of the moon *on incontestable principles*; that you have determined six general inequalities not formerly known; and that nevertheless the calculations will not be much more troublesome or difficult than formerly. I am heartily glad to hear this, and should be more so to have it from yourself, for in truth I suspect you are scarce so forward; and I flatter myself with the opinion, that if you were, you would have acquainted me with it, as you promised both when I imparted the three synopses of lunar calculations, and observed places to you, and in your letters since. Pray let me know how far you are proceeded, you will oblige me, and, if you please, the true reason *why I have had no letters from you this four months.*”¹ Newton does not seem to have answered this letter. His appointment to the Mint, though not officially communicated to him, was well known; and all his time must have been occupied in preparing for the discharge of its duties.

In reviewing the remarkable correspondence which terminates with the preceding letter, and which has been regarded in such different lights, we have no hesitation in saying, that the two charges against Flamsteed of ignorance of the importance of the theory of gravity, and of unwillingness to supply Newton with the observations he required for his lunar theory, have no sufficient foundation. With the exception of those occasional bursts

¹ In this letter, Flamsteed tells him that “some friends of his who live at a distance in the country, have made new tables for representing the motions of the two superior planets, Jupiter and Saturn,” within ten or twelve minutes of observation. I find other four letters from Flamsteed to Newton, dated September 4, December 10, 1697, December 29, 1698, and January 9, 1699. The last of these letters is a long and curious reply to Newton on the subject of his letter of the 6th January 1699, blaming Flamsteed for mentioning his theory of the moon in a letter on the parallax of the fixed stars, sent to Dr. Wallis to be printed. The consideration of these letters belongs to another Chapter.

of spleen against Halley, which must have been annoying to his friend, his letters to Newton—though sometimes of an irritating tendency—are yet respectful, and even affectionate, and exhibit not only a willingness, but an anxious desire to supply him with every observation he possessed, and even to make and to reduce new observations expressly for his use. His ill health, which often required him to travel for its recovery—his severe headaches, a pulmonary affection, and sharp attacks of the stone and gravel, frequently unfitted him for observing and reducing his observations, while the want of computers, for whose labours he was obliged to pay, and the necessity of visiting his living at Burstow, often prevented him from communicating his observations as quickly as Newton wished, and as he himself desired. When his letters are published, and read along with those of his correspondent, his good name will not, from this cause, greatly suffer in the estimation of posterity. Flamsteed was not the less a great man that he has been confronted with the greatest.

But while we thus justify the Astronomer-Royal, we must make some apology for the philosopher. Newton was not in good health during the correspondence which we have been examining. The depths of his mind were stirred with the difficulties of the lunar problem. The new views which burst upon him in its solution could be tested only by observation; and they who have felt the impatience of spirit when a speculation waits for the verdict of an experiment or a fact, or who have started from their midnight couch to submit a happy idea to the ordeal of observation, will understand the sensitiveness of Newton when he waited whole weeks for the precious numbers which the Observatory of Greenwich only could supply. Newton certainly thought, as his letter of the 9th July shows, that the Astronomer-Royal had not been sufficiently active in his cause; and though he knew that he had no other right but that of courtesy to the observations he required, yet he had established another ground of right which he was entitled to urge,—the social right of reciprocal obligation. He had given Flamsteed

valuable tables of refraction, and had computed months of labour; the equations for the apogee and other important tables of horizontal parallaxes, for the purpose of making some return for the observations which he required. He was, therefore, entitled to press these grounds of claim upon Flamsteed when he thought "he saw so little prospect of obtaining what he wanted," as to make him "despair of compassing the lunar theory," and "giving it over as a thing impracticable."

Regarding the letter of Newton in this light, we have been greatly surprised at the view taken of it, and indeed of all his letters, by M. Biot. No philosopher, either of our own or of Newton's day, has done more justice to his labours, or shown a deeper affection for his memory, than that distinguished philosopher; and there is no living writer, whose appreciation of the feats of science is more valuable than his; but the view which he has taken of the idle story of M. Colin and the dog Diamond, charged with fire-raising among Newton's manuscripts, and of the influence of this accident upon the mind of their author, is to us, and, we believe, to every Englishman, utterly incomprehensible. The story of the burning of the papers about 1691 or 1692, is entirely fabulous;¹ but even if it were true, it produced no effect upon Newton's mind. His illness at that time, the want of his usual consistency of mind, a condition which every deep thinker must have experienced, arose, as he himself distinctly declares, from want of sleep and appetite during the preceding year.

"Is it then," says M. Biot, "going too far to see in the *incoherence* of these letters (the letters to Flamsteed) a fatal resemblance to those which Newton wrote to Pepys and Locke *two years* before, and almost in the same months? Do we not equally discover in them the morbid irritability of a mind fatigued by the continuity of its meditations, and which, *according to the avowal of Newton himself, could no longer sustain*

¹ We have already shown that this accident happened before 1684.

*such great efforts?*¹ And if it be true that, at the end of 1692, the fire which destroyed a part of his works had already produced in him moral symptoms of the same kind, still more distressing, why should we be surprised to see him brought back to it by the renewal of researches as profound and as fatiguing on account of the vagueness of the data at his command, as were those which he executed and attempted on refractions and the lunar theory, from the months of October 1694 to September 1695, as we have already related. *This was his last spark.*"²

M. Biot has expressed his surprise at the sensitiveness of Englishmen, on the allegation that Newton "had fallen into phrenitis"—that is, was insane in 1692; but, however great that surprise may be, it cannot be equal to that which they feel at his persisting in the statement, and at the offensive aggravation of it, which is contained in the preceding extract. Before M. Biot had read the letters to Flamsteed, he had declared that Newton's intellect was permanently weakened by his illness of 1692, and yet he now finds, by the perusal of these letters, that Newton had put forth his highest powers *two years* after that event! But what surprises and offends us, and what must offend every friend of truth and of genius, is his new allegation, that Newton's great intellectual efforts in 1694 and 1695 brought him back into his phrenitis of 1692, from which he never recovered his usual powers of invention and discovery. His letters to Flamsteed exhibit no such symptoms, no incoherence of mind, and no failure of a mental or moral nature. In 1696, when he exchanged the daily pursuit of science for the active and engrossing duties of official life, he was capable of developing the highest powers of his genius. He displayed them in the preparation of the second edition of

¹ Newton has made no such avowal. Biot quotes, in support of his allegation, Newton's declaration to Locke, that "he had not his former consistency of mind,"—a mere temporary state, from which he completely recovered.

² *Journal des Savans*, November 1836, p. 657.

the *Principia*, and in his *Optics*. They appeared fresh and vigorous during the fluxionary controversy. They shone with a more subdued light in the discharge of his duties at the Mint ; and no period of his life can be named when his intellectual arm was shortened, or his mental eye was dim. Even in extreme old age, his robust frame protected from decay the bright spirit which it enclosed, and, ripe for the spiritual world which he had ever contemplated as his home, he adorned the last years of his long and honoured life with the humility of the sage and the graces of the Christian.

CHAPTER XIX.

No mark of National Gratitude conferred upon Newton—Friendship between him and Charles Montague, afterwards Earl of Halifax—Montague appointed Chancellor of the Exchequer in 1694—He resolves upon a Re-coinage—His Letter nominating Newton Warden of the Mint in 1696—Newton appointed Master of the Mint when Montague was First Lord of the Treasury—His Report on the Coinage—Anecdote of his Integrity when offered a Bribe—He obtains for Halley the Deputy-Comptrollership of the Mint at Chester—Quarrels among the Officers there—Disturbances in the London Mint—New Misunderstanding with Flamsteed—Remarkable Letter to him from Newton—Newton's conduct defended—The French Academy of Sciences remodelled—Newton elected one of the Eight Foreign Associates—M. Geoffroy describes to Dr. Sloane the change in the Academy—Newton resigns his Professorship and Fellowship at Cambridge—Whiston appointed his Successor—Newton elected Member for the University in 1701, and President of the Royal Society in 1703—Queen Anne confers upon him the honour of Knighthood in 1705—Love-Letter to Lady Norris—His Letter to his Niece, Miss C. Barton—Account of Sir William and Lady Norris—Letters of Newton about standing for the University in 1705—Letters of Halifax to Newton on that occasion—Newton and Godolphin defeated.

HITHERTO we have viewed Newton chiefly as a philosopher, leading a life of seclusion within the walls of a college, and either engaged in the duties of the Lucasian Chair, or constantly occupied in mathematical and scientific inquiries. He had now reached the fifty-third year of his age, and though his friends had exerted themselves to procure him some permanent appointment, they had failed in the attempt. An event, however, now occurred which relieved him from his labours at Cambridge, and placed him in a situation of affluence and honour.

Among his friends at Cambridge, Newton had the good fortune to number Charles Montague, fourth son of George Mon-

tague, Esq. of Harton in Northamptonshire, whose father was Henry, first Earl of Manchester. He was born on the 16th April 1661, and exhibited early indications of genius and talent. From Westminster school, where he was elected King's Scholar, he entered Trinity College, Cambridge, as a Fellow Commoner on the 19th November 1679, and received the degree of M. A. by royal mandate on the 6th October 1681. Here he became acquainted with Newton; and though devoted to literary pursuits, an ardent friendship arose between them which various causes contributed to strengthen and maintain. In the year 1685, when Montague was only twenty-three years of age, we find him co-operating with Newton and others in establishing a Philosophical Society at Cambridge; but though both of them had made personal application to different individuals to become members, yet the plan failed from the want of persons willing to try experiments, and from the refusal of one individual on whom they relied for that species of assistance.

While yet at college, Mr. Montague was brought into notice by a poem which he wrote on the death of Charles II. in 1685. The Earl of Dorset, who happened to admire it, invited him to London, where an incident occurred which "led him on to fortune." Having, in conjunction with Matthew Prior, published a poem entitled "The Hind and the Panther, transversed to the Story of the Country Mouse, and the City Mouse," his patron the Earl of Dorset introduced him to King William in the following manner: "May it please your Majesty, I have brought *a mouse* to have the honour of kissing your hand," and having learned the reason why Mr. Montague was so called, he smiled and replied, "You will do well to put me in the way of making *a man* of him," and he immediately gave orders that a pension of five hundred pounds per annum should be paid to him out of the privy purse till an opportunity should occur of giving him an appointment. When Prior learned the good fortune of the more favoured mouse, he wittily exclaimed—

“ My friend Charles Montague's preferred,
Nor could I have it long observed
That one mouse eats, while t'other's starved.”

In 1687, when Newton was occupied with the completion of his *Principia*, he was in correspondence with Montague, whom he characterizes as his “intimate friend,”¹ and notwithstanding the contrariety of their pursuits, and the great difference of their age, the young statesman cherished for the philosopher all the veneration of a disciple, and his affection for him gathered new strength as he rose to the highest offices and honours of the state.

Mr. Montague sat along with Newton in the Convention Parliament, and such were his habits of business, and the powers which he displayed as a public speaker, that he was appointed a Commissioner of the Treasury, and soon afterwards a Privy Councillor. In 1694 he was elevated to the Chancellorship of the Exchequer; and as the current coin of the realm had been adulterated and debased, one of his earliest designs was to re-coin it and restore it to its original value. In 1698 he was appointed First Commissioner of the Treasury, and one of the Lords Justices of England during the absence of the king in Holland; and in 1700 he was raised to the peerage with the title of Baron of Halifax, in the county of York.

The scheme of the re-coinage, like all measures of reform, encountered great opposition. It was characterized as a wild project, unsuitable to a period of war, as highly injurious to the interests of commerce, and as likely to sap the foundation of the government. The Chancellor of the Exchequer, however, was not influenced by the cries of faction. He had studied the subject with the deepest attention, and had entrenched himself behind opinions too impartial and too well founded, to be driven from a measure which the best interests of his country seemed to require. Having consulted Newton, Locke, and Halley, he immediately took measures to carry his plan into effect. The

¹ See Vol. i. APPENDIX No. VIII., p. 413.

advantage of having proper officers for superintending the re-coinage must have presented itself to the minds of his advisers, and we have no doubt that Locke and Halley warmly seconded his own desire to place Newton in one of the principal offices in the Mint. We have already seen that the Comptrollership had been, some years before, mentioned as a suitable office for Newton, and so early as November 1695, Dr. Wallis, in a letter to Halley,¹ mentions a rumour at Oxford that he had been actually appointed to the Mastership of the Mint. This, however, was a mistake, as there was no vacancy in the Mint till the beginning of 1695 $\frac{5}{6}$. Mr. Overton, the Warden, was then made a Commissioner of Customs, and Mr. Montague embraced the opportunity thus offered to him of serving his friend and his country by recommending Newton to that important situation. This appointment was notified to him by the following letter, addressed to him at Cambridge :—

¹ *ms.*

“ 19th March 1695.²”

“ SIR,—I am very glad that at last I can give you a good proof of my friendship, and the esteem the king has of your merits. Mr. Overton, the Warden of the Mint, is made one of the Commissioners of the Customs, and the king has promised me to make Mr. Newton Warden of the Mint. The office is the most proper for you. 'Tis the chief officer in the Mint. 'Tis worth five or six hundred pounds per annum, and has not too much business to require more attendance than you may spare. I desire you will come up as soon as you can, and I will take care of your warrant in the meantime. Pray give my humble services to John Lawton.³ I am sorry I have not been able to

¹ November 26th. See Edleston's *Correspondence*, &c. lxviii., note, 126, and p. 302, Appendix.

² The date of this letter should have been 1695 $\frac{5}{6}$.

³ Mr. Lawton, or Laughton, was a great personal friend of Sir Isaac Newton and Charles Montague. He was afterwards Librarian and Chaplain of Trinity. He subsequently became Canon of Worcester and Lichfield, and gave to the Library of Trinity College a valuable collection of books. See p. 51, and Monk's *Life of Bentley*, pp. 226, 243.

assist him hitherto, but I hope he will be provided for ere long, and tell him that the session is near ending, and I expect to have his company when I am able to enjoy it. Let me see you as soon as you come to town, that I may carry you to kiss the king's hand. I believe you may have a lodging near me.¹—I am, Sir, your most obedient servant,

“ CHAS. MONTAGUE.”

This letter must have been the occasion of much surprise to Newton and his friends ; for only five days previous to its date, namely, on the 14th of March, he had intimated to Halley that “ if the rumour of preferment for me in the Mint should hereafter, upon the death of Mr. Hoare, or any other occasion, be revived, I pray that you would endeavour to obviate it by acquainting your friends that I neither put in for any place in the Mint, nor would meddle with Mr. Hoare's place² were it offered me.” About three months before Newton's appointment, Mr. Montague had been placed at the head of the Royal Society,³ and it must have been very gratifying to the Fellows, that their most distinguished member had been promoted by their new president. When it was stated “ that Mr. Montague gave Newton employment before he wanted it or asked it,” either Montague or some one else replied, “ *that he would not suffer the lamp which gave so much light to want oil.*”⁴

Thus refreshed, the lamp continued to burn, and with no flickering light. Its asbestos torch, though kept at a high temperature for a quarter of a century, was unconsumed, and required only the gaseous material to make it continue its brilliant though chastened light ; and, as if to give a prophetic reply to the allegation that his mind had been injuriously overwrought by study and enervated by office, he solved, about a

¹ Copied from the original.

² Mr. Hoare was Comptroller of the Mint.

³ He was elected on the 30th of November 1695, and resigned at the same date in 1699.

⁴ Conduitt's MSS.

year after his appointment, the celebrated problems with which John Bernoulli challenged "the acutest mathematicians in the world." When the great geometer of Basle saw the anonymous solution, he recognised the intellectual lion by the grandeur of his claw; and in their future contests on the fluxionary controversy, both he and Leibnitz had reason to feel that the sovereign of the forest, though assailed by invisible marksmen, had neither lost a tooth nor broken a claw.

In the new and responsible situation to which Newton was elevated, his chemical knowledge was of great use to the country; and, in effecting the re-coinage, which was completed towards the close of 1699, his services were so highly appreciated, that the Chancellor of the Exchequer declared that he could not have carried it on without his assistance. In the year 1699, when the situation of master and worker of the Mint became vacant, Mr. Montague was First Lord of the Treasury, and through his influence Newton was promoted to that high office, which was worth from twelve to fifteen hundred pounds per annum, and which he held during the remainder of his life.¹ In this situation he drew up an official report on the coinage in 1717, and Mr. Conduitt says, "that he behaved himself with an universal character of integrity and disinterestedness, and had frequent opportunities of employing his skill in numbers, particularly in his Table of Assays of Foreign Coins, which is printed in the Book of Coins lately published by Dr. Arbuthnot."²

¹ Among Newton's papers, I found the following list of his securities, which, I presume, must be those which were required when he was elevated to the Mastership of the Mint:—

Mr. Newton,	£2000
And Bondsmen,	
Rt. Honble. Charles Montague,	1000
Thomas Hall, Esq.,	1000
— Flayer, Esq.,	1000
Thos. Pilkington, gent.,	1000
	<hr/>
	£6000

² Conduitt's MSS. Dr. Arbuthnot's work was published in 4to, in 1727, under the title

A very remarkable proof of Newton's integrity is given in the following interesting extract of a letter from the Rev. Dr. Derham to Mr. Conduitt :¹—"The last thing, Sir, that I shall trouble you with, shall be a passage relating to the coinage of the copper money some years ago, which pleased me much in setting forth the integrity of my friend Sir Isaac. The occasion of our discourse was, the great inconveniences which many underwent by the delay of the coinage of this sort of money. The occasion of which delay, Sir Isaac told me, was from the numerous petitions that were presented to them, in most of which some person or other of quality was concerned. Amongst others, he told me that an agent of one had made him an offer of above £6000, which Sir Isaac refusing on account of its being a bribe, the agent said he saw no dishonesty in the acceptance of the offer, and that Sir Isaac understood not his own interest. To which Sir Isaac replied, that he knew well enough what was his duty, and that no bribes should corrupt him. The agent then told him, that he came from a great Dutchesse, and pleaded her quality and interest. To which Sir Isaac roughly answered, 'I desire you to tell the lady, that if she was here herself, and had made me this offer, I would have desired her to go out of my house ; and so I desire you, or you shall be turned out.' Afterwards he learned who the Dutchesse was."

The elevation of Newton to the Mint led to the promotion of his friend, Dr. Halley, to an office in the same establishment. He was made Deputy-Comptroller of the Mint at Chester, in 1696, the office of Comptroller being at that time held by Mr. Thomas Molyneux. Soon after his appointment, disturbances of a very serious kind arose among the officers. Mr. Halley, and Mr. Woodall the Warden, feeling it their duty to see the

of Tables of Ancient Coins, Weights, and Measures, Explained and Exemplified in several Dissertations. It was reprinted in 1754, with observations by Dr. Benjamin Langworth.

¹ This letter, dated Upminster, 18th July 1733, was written when Mr. Conduitt requested information regarding Newton from Dr. Derham, who had been intimately acquainted with him for about thirty years.

King's business well and faithfully performed, had insisted upon correcting certain irregularities in the proceedings of Bowles and Lewis, two clerks in the establishment. The Master of the Mint, a Mr. Clark, espoused the cause of the clerks, and, "pretending to take offence at something that nobody else had observed in the company, went and borrowed Bowles his sword, to waylay the Warden as he went home." He did not, however, fulfil his threat, but some time after he sent a challenge to the Warden, which was accepted. "He appeared, however, on the ground," says Halley, "before the hour, with his man and horses, and staid not after it, by which means they fought not, and I demonstrated the folly of such decisions that went no farther."¹ In the same spirit, Lewis, the clerk of the Warden, threw a standish at Mr. Woodall, and he and the Master brought forward all sorts of charges against Halley and Woodall. Halley was accused of showing a preference to individuals in the purchase of silver, and of committing professional blunders in adding an alloy to what is called *schissell*, and thus diminishing the purity of the coin; while the Warden was charged with having used expressions of a treasonable nature, dangerous to the Government. Halley was at first greatly annoyed by these dissensions, and, in requesting Newton to interfere for his protection, he expressed a hope "that his potent friend, Mr. Montague, would not forget him, if there should be occasion."² When Parliament had voted the continuance of the five country mints, Halley desires "that Lewis may appear face to face with him before the Lords, there to answer to his throwing the standish at Mr. Woodall, the giving the undue preference to Palford, and some other accusations of that nature, I am prepared to lay before their Lordships. I came to town purposely to charge that proud, insolent fellow, whom I humbly beg you to believe the principal author of all the disturbance we have had at our mint, whom if you please to see removed all will be easy; and on that condition I am content to submit to all you shall pre-

¹ Letter to Molyneux, August 25, 1697.

² August 2, 1697.

scribe to me. Nevertheless, as I have often wrote you, I would urge you to nothing but what your great prudence shall think proper, since it is to your particular favour I owe this post, which it is my chiefest ambition to maintain worthily, and next to that to approve myself in all things.”¹ In the same letter he speaks of his resignation, but as he is unwilling “that Lewis and Clark should interpret it to be any other than a voluntary cession,” he thinks it necessary to prosecute the charges against them.²

Before these dissensions had come to this crisis, Newton had offered, in February 1697, to procure for Halley an “engineer’s place,” through a Mr. Samuel Newton. Halley³ expressed his willingness to accept of this kind offer, provided Sir Martin Beckman was of opinion that the post was likely to be durable; but two days before the date of Halley’s letter, Newton⁴ had offered him a situation worth ten shillings a week, to teach the mathematical grounds of engineering two hours a day to the engineers and officers of the army; but he seems to have declined both these situations. When the five country mints were discontinued in 1698, Halley, at his own desire, was appointed by the King to the command of the *Paramour Pink*, which sailed in November 1698, in order that he might study the variation of the needle in different parts of the globe.⁵

¹ Letter to Newton, dated December 30, 1697.

² These facts are gleaned from four unpublished letters to Newton, and three to Molyneux.

³ February 1697.

⁴ *Macclesfield Correspondence*, vol. ii. p. 420.

⁵ Halley was one of the most distinguished and accomplished philosophers of the seventeenth and eighteenth centuries. On the death of Dr. Wallis, in 1703, he was appointed Savilian Professor of Geometry in Oxford. In 1703, he was chosen Secretary to the Royal Society, and, in 1719, in the sixty-third year of his age, he succeeded Flamsteed as Astronomer-Royal. In 1729, he was elected a corresponding Member of the Academy of Sciences at Paris, and he died on the 14th January 1742, in the eighty-sixth year of his age. In his *Eloge* upon Halley, M. Mairan thus speaks of him:—“While we thought the eulogium of an astronomer, a naturalist, a scholar, and a philosopher, comprehended our whole subject, we have been insensibly surprised with the history of an excellent mariner, an illustrious traveller, an able engineer, and almost a statesman.”—*Mém. Acad. Par.* 1742.

While Newton was thus disturbed by the quarrels of the Chester Mint, in which he had personally no share, his tranquillity was more seriously compromised by disputes which arose under his own eye, and in which his character was concerned.

In the year 1697, a person of the name of William Chaloner, who is stated to have made experiments connected with the Mint "for the Parliament," pretended that he had discovered certain abuses in that establishment, and was sent for by a committee of the House of Commons to give information on the subject. Dreading, however, the personal consequences to which he might be exposed, he obtained a promise of protection from the committee, and he then disclosed several abuses alleged to have been committed in that department, and pointed out the methods by which false money was coined, and the mode of effectually preventing it. Some of the functionaries of the Mint having heard of these disclosures, and of Chaloner's having promised to "write a book on the present state of the Mint," are said to have threatened to take away his life before the next sitting of Parliament. Hearing of this threat, a Member of the House was, by its direction, appointed to represent his case to the King, who promised "that he should suffer no damage for the discoveries he had made, and that he would provide for him for the service he had rendered." Notwithstanding these proceedings, the officers of the Mint, as Chaloner states, committed him to Newgate, and, after keeping him in irons for seven weeks, they preferred against him a Bill of Indictment; but having no evidence to produce, they laid a plot to induce him "to coin false money," and thus to destroy his testimony against themselves. With this view Richard Morris, a messenger of the Mint, having apprehended for high treason John Peers, a clock-maker in the city, together with his wife, kept them prisoners in his own house, and told them that they were in great danger of being hanged, "unless they would undertake to do service to the Government." This service, according to the affidavit of

Peers, was to engage Chaloner "to be concerned in coining with them." Peers undertook the task, and arranged with Captain Harris, the Mint engraver, that a place in the establishment would be the reward of his success. Peers and his wife were with this view "bailed before Mr. Justice Negus." But though they used every means in their power, they could not succeed in alluring Mr. Chaloner. Peers then renewed the attempt with Holloway, a turner, and one Prince. For this purpose they went to the country provided with tools, and coined several plated shillings; but before they had applied to Chaloner, they availed themselves of their position, and circulated some of these shillings as legal coin.

In this state of matters, Sir Isaac, as Warden of the Mint, granted a warrant for the apprehension of Peers, but having sent for him, and learned that he was at work with Holloway and Prince, "to get Mr. Chaloner to be concerned in coining with them," Sir Isaac is said to have highly approved of the plan as one well-contrived, and to have given Peers five shillings and liberty to coin money, in order to promote the object they had in view. Upon being questioned by Sir Isaac concerning Chaloner, "whom he had assisted in experiments for Parliament," Peers told him that he knew nothing against Chaloner, excepting that one Moore had prevailed upon himself to make for him a tool to edge or mill money, when he was working with Chaloner; that Chaloner told him he would be hanged if he did such a thing, and was indignant at the idea of its being done with his tools. Chaloner, however, afterwards told Peers, that if Moore should force him to make the tool by threats, "he should make it of iron, *that it might not answer the end to mill money with it.*" When Sir Isaac heard the amount of this charge against Chaloner, he is said to have told Peers "that these advices were not material against him;" and to have given through Morris, four pounds, to carry on the design of entrapping Chaloner. Holloway, however, having heard that Peers had been with the Warden, suspected that he himself

would be taken up, and gave Peers and Prince in charge to a constable, who committed them to Newgate for high treason. Sir Isaac hearing of this, went to Newgate, and, having been assured by Peers that he had done nothing in coining excepting what he had been told to do by himself and Captain Harris and Morris, "in order to draw in Mr. Chaloner," he agreed to admit him to bail the next day.

Holloway also made an affidavit, and swore "that he heard Isaac Newton, Esq., Warden of the Mint, and his clerk and Morris, all say, that the said Chaloner should not be tried until the last day of the Sessions, for then he was sure to be tried by the Recorder, they being sensible that the Recorder was Chaloner's enemy;" or, as Peers expressed it in his affidavit, "that as the Recorder had a prejudice against Chaloner, he would certainly do his business." By the evidence of Morris, and the story of the tool made for Moore, a bill for high treason was found by the grand jury against Chaloner.

Under these circumstances, Chaloner presented a petition to Parliament on the 18th July 1697-8, "praying that his sufferings and ruined condition might be considered and redressed." The petition was referred to a large committee, one of whom was Charles Montague, with instructions to send for any information against Chaloner, and report to the House. New members were added to the committee on the 2d of March: The committee got leave to sit on the 8th, and other members were added on the 28th, but it does not appear from the journals of the House that any report was given in, or any farther proceedings taken in the matter.¹

As this singular story involves charges deeply affecting the character of Sir Isaac, and as these are contained in printed papers, and probably in unpublished records of the House of Commons, which might some day come to light when there was

¹ The preceding statement is taken from a printed copy of the petition of Chaloner, with which Mr. Edleston has kindly favoured me. The affidavits of Holloway and Peers, annexed to the petition, are dated in November and December 1697.

no opportunity of defending him, and perhaps no means of defence, I felt it a sacred duty to inquire into their origin and history. Had they rested on any foundation, and been the subject of public or private discussion, Charles Montague, then Chancellor of the Exchequer, against whom the spirit of party ran high, would doubtless have been questioned in the House of Commons; and Flamsteed, in his private correspondence with Abraham Sharpe, would not have failed to record the failings of his friend. It was therefore probable, both from the character of Newton and the silence of his contemporaries, that some palliation of his conduct, or some exposure of the calumny, might yet be discovered.

Through the kindness of Lord Brougham, to whom I submitted the case, inquiries were made in the House of Commons, the Mint, and the British Museum; but it is only from the latter that any useful information has been obtained. Mr. Panizzi found three printed papers by Chaloner, one of which was a proposal, dated February 11, 1694, and addressed to the House of Commons, that they should pass an Act to prevent the clipping and counterfeiting of money; another containing reasons against the resolutions of the committee appointed to revise these proposals; and a third, pointing out the defects in the constitution of the Mint. Mr. Panizzi likewise found a tract, containing an account of the life and execution of Chaloner, which completely exculpates Newton from the charges brought forward in the petition to the House of Commons.¹ Chaloner seems to have been a man of extraordinary talent, who, in order to conceal his own criminality, brought false accusations against the officers of the Mint. "He scorned," says his biographer, "to fly at low matters. He pretended his commitment to be malicious, and accused that

¹ Entitled, *Guzmanus Redivivus. A Short View of the Life of William Chaloner, the Notorious Coyner, who was executed at Tyburn, on Wednesday, the 22d of March 1698*, with a brief Account of his Tryal, Behaviour, and Last Speech. London: J. Haynes. 12mo, 1700; pp. 12.

worthy gentleman, Isaac Newton, Esq., Warden of His Majesty's Mint, with several other officers thereof, as connivers (at least) at many abuses and cheats there committed. This accusation he impudently put into Parliament, and a committee was appointed to examine the same, who, upon a full hearing of the matter, dismissed the same gentleman with the honour due to his merit, and Chaloner with the character he deserved."¹

While Newton was thus distracted by the quarrel among the functionaries of the Mint at Chester, and by the charges against himself, his tranquillity was disturbed by another misunderstanding with Flamsteed. He had now resumed his inquiry into the lunar irregularities ; and "on Sunday the 4th December 1698, in the time of evening service," he went to Greenwich to obtain twelve computed places of the moon, which Flamsteed had corrected for him, in consequence of the places formerly given him not having been correct. On the 29th December, Flamsteed sent him a correction of the time in one of the observations ; and having afterwards discovered that the results required to be still farther improved, he waited upon Newton on the 30th or 31st December, to acquaint him with the fact. According to Flamsteed, Newton was "reserved to him contrary to his promise ;" that is, he was reserved, as Mr. Baily interprets it, in not imparting to him the particulars of his lunar theory ; or, as Mr. Edleston thinks, reserved in his manner from being at that time displeased with Flamsteed.

When Dr. Wallis was preparing the third volume of his works, he requested from the Astronomer-Royal his observations on the parallax of the earth's annual orbit. Flamsteed complied with his request ; but without supposing that it would be offensive to Newton, he made the following reference

¹ Chaloner had been three times under prosecution before he petitioned the House of Commons. He was finally apprehended for forging Malt Tickets ; but when tried for coining, he feigned madness to avoid pleading. He was however found guilty of high treason by "a cloud of witnesses," and executed,—abusing the Judge and the Jury, and declaring to the last that the witnesses, particularly Holloway, had perjured themselves.

to his lunar theory :—"I had become intimate with Mr. Newton, then the most learned man of the day, and Professor of Mathematics in the University of Cambridge, to whom I had given 150 places of the moon deduced from my observations, and at the same time her places as computed from my tables, and I promised him similar ones in future as I obtained them, along with the elements of my calculations for the improvement of the Horroxian theory of the moon, in which matter I hope he will have all the success which he expects."¹ Dr. Gregory having heard from Wallis of this allusion to the lunar theory, mentioned it to Newton, who took it very much amiss, and begged that Gregory would request Wallis to suppress the clause. When Flamsteed heard of this request from Wallis, he wrote to Newton a long letter, dated January 2, 1699, transmitting to him the offensive paragraph,—reminding him that it contained nothing but what Newton himself had acknowledged to many of his friends, and proposing to leave out the word *Horroxianæ*, which was put in because Newton "allowed that theory as far as it goes."² As Newton did not reply to this letter, Flamsteed wrote to him again on the 5th, and drew from him the following expostulation :—

"JERMYN STREET, *January 6, 1698-9.*

"SIR,—Upon hearing occasionally that you had sent a letter to Dr. Wallis about the parallax of the fixed stars to be printed, and what you had mentioned therein with respect to the theory of the moon, I was concerned to be publicly brought upon the stage about what, perhaps, will never be fitted for the public, and thereby the world put into an expectation of what, perhaps, they are never like to have. I do not love to be

¹ In the Latin version of this passage, given by Bailly in p. 668, for *similium* read *similia*, for *posteriore* read *posterum*, for *enarrare* read *qua in re*; for *cum* [*eorum* ?] read *eum*; and for *censeas harum* read *consecuturum*.

² As this letter derives a peculiar interest from its connexion with the remarkable letter of Newton of January 6th, which has been the subject of so much discussion, we have printed it in the APPENDIX, No. XII.

printed on every occasion, much less to be dunned and teased by foreigners about mathematical things, or to be thought by our own people to be trifling away my time about them, when I should be about the King's business. And, therefore, I desired Dr. Gregory to write to Dr. Wallis, against printing that clause which related to that theory, and mentioned me about it. You may let the world know, if you please, how well you are stored with observations of all sorts, and what calculations you have made towards rectifying the theories of the heavenly motions. But there may be cases wherein your friends should not be published without their leave. And, therefore, I hope you will so order the matter, that I may not on this occasion be brought upon the stage.—I am, your humble servant,
“IS. NEWTON.”

This letter has been characterized by Mr. Baily as a “most extraordinary” production; and another writer represents it as unworthy of Newton's transcendent genius, and Newton as “indignant,” and taking fire at the paragraph sent to Wallis, which he says “was obviously written without the slightest intention to give offence.” If Newton had written this letter as a simple expression of his feelings, upon hearing that his lunar theory had been mentioned by Flamsteed, as these writers, without any authority, assume, we should have regarded it as unseemly, and as a display of unnecessary feeling. But this was not the case. Newton did nothing more than request Dr. Wallis to leave out the paragraph; and Mr. Baily knew, and the other writer ought to have known,¹ that the letter was extracted from Newton by the two letters of Flamsteed, which we have already mentioned, and which, for anything they knew, might have been written in such a tone as to make Newton's letter appear an amiable, in place of an extraordinary production. Mr. Flamsteed's first letter of January 2d was a provoking letter, and yet Newton did not reply to it; and it is

¹ See Baily's *Flamsteed*, p. 164.

very probable that Flamsteed's second letter, which extorted an answer, was still more annoying; for it is quite clear, from his own note, that he was greatly offended at Newton for delaying to answer it.¹

But independently of these circumstances, Newton was entitled to express his feelings at being "brought upon the stage," and thus exposed to being dunned and teased by foreigners; and what is still more in his favour, he had peculiar reasons at that very time to prevent the belief that he was occupied with anything else than "the King's business." The great recoinage of silver was now going on. Some of the provincial mints were in a state of anarchy; and the Mint itself was charged before Parliament with the toleration of grave abuses, which might have been attributed to Newton as its Master. In thus justifying Newton, we do not mean to attach much blame to Flamsteed. He should have asked Newton's permission to print the obnoxious paragraph, and, when it was printed, Newton should have requested its suppression from Flamsteed himself, and ought to have returned an answer to the letter of explanation which had been sent him.

Notwithstanding these differences, Flamsteed continued to visit Newton when he went to London, to promise him his observations when he required them, and to converse upon the tender subject of the printing of the Greenwich observations. On the 3d of May 1700, Flamsteed paid one of these visits, and has given such a graphic account of it in a letter to Lowthorp¹ a week after, that it gives us some insight into the peculiarities of both these great men. Flamsteed went before Newton was up, and "waited his rising." He found a Bible in his room, which he seems to have read, "and meeting," he says, "with a sheet of paper, I wrote upon it this distich, which I remembered from a late satire,—

¹ Flamsteed answered Newton's letter on the 10th of January, in a very contrite spirit, and sent him the paragraph as altered by Wallis.

² Baily's *Flamsteed*, pp. 174, 175.

A bantering spirit has our men possessed,
And Wisdom is become a standing jest.

Read Jeremiah, chap. ix. to the 10th verse.

I do not know whether he has read it, but I think he cannot take it amiss if he has ; and if he reflects a little on it, he will find I have given him a reasonable caution against his credulity, and showed him the way of the world much better than his politics or a play could do." When the subject of printing his observations was started, and Flamsteed had explained the order in which they were to be given, he added, "that the book of tables would follow." At this Newton started, and asked him, "what tables?" and "if I would publish any for the moon?" "My answer was, that she was in his hands, and if he would finish her, I would lend him my assistance ; if not, I would fall upon her myself when I had leisure." During "the discourse," Newton complained of his friend's reserve, which Flamsteed denied, and said, that if he would come down some morning with Sir Christopher Wren and take his dinner with him, "he should then see in what forwardness his work was, and we would consider how to forward it to the press."

The reputation of Newton had been gradually extending itself on the Continent, as his philosophy became better known. James Cassini, the celebrated French astronomer, came to England, after the peace of Ryswick,¹ to pay Newton a visit, and is said to have offered him a large pension from the French king, which he refused ;² and it was probably on the suggestion of Cassini that he was appointed one of the eight foreign

¹ The Treaty of Ryswick was signed in 1697.

² I have given this anecdote in the words of Conduitt, which cannot be correct. James Cassini, the younger, paid a visit to London in the early part of 1698, as appears from the following short note, in which he communicates from his father the periodic times of the five satellites of Saturn, slightly different from those published in the 2d Edit. of the *Principia*, p. 960.

"Clarissimo viro Domino Isak Newton, Jacobus Cassini, S.P.D.

"Cum e Londino reversurus in Galliam huc pervenissem, accepi a patre meo epistolam una cum maximis satellitum Saturni digressionibus quas a me expostulaveras. Has tibi mandare et gratitudinem meam tuorum erga me beneficiorum simul exhibere

associates of the Academy of Sciences, who were created on the remodelling of the Academy in 1699.¹

A short time after this election, namely, on the 7th of March, M. Geoffroy, one of the members of the Academy, transmitted to Dr. Sloane, the Secretary of the Royal Society, a list of the eight foreign associates, containing the name of Newton; and gave him the following account of the new organization of the Academy: "I shall here give you an account of the great splendour that the Académie des Sciences has received by the regulation, increase, encouragement, and order, M. l'Abbé Bignon has obtained to it from the king. That Academy is now composed of ten honorary academicians, which are chosen learned and eminent gentlemen, of eight strangers associates, each of which is distinguished by his learning—twenty pensioners fellows; twenty élèves; twelve French associates. Between the honorary academicians, two are elected every year, one for president, the other for vice-president. Twenty pensioners have every year 1500 French livres; and after the death of one pensioner, the Académie will propose to the king three persons, associates or élèves, or sometimes others, and his Majesty will call one of the three for pensioner."²

While Newton held the inferior office of Warden of the mih i liceat. Tuam domum adivi ut te inviserem, sed mala usus fortuna cum nunc ab-
fuisses. Vale vir clarissime, et sic habeas me tibi semper esse addictissimum. Dover,
diè 6 Aprilis, 1698, St. N."

¹ The eight foreign Associates created on this occasion were—

1. Leibnitz.	}	February 4.
2. Guglielmini.		
3. Hartsoecker.		
4. Tschirnhausen.		
5. James Bernoulli.	}	February 14.
6. John Bernoulli.		
7. Newton.	}	February 21.
8. Roemer.		

Newton and Roemer, and the two Bernoullis, were nominated by the Academy, and the other four by the King.—Edleston's *Correspondence*, &c., p. lxix.

² Mr. Weld has published this letter from the Letter-Book of the Royal Society, "as marking the different manner in which the great learned societies of England and France were treated by their respective sovereigns. In the latter country, science was thus

Mint, he retained the Lucasian Chair ; but upon his promotion to the Mastership in 1699, he appointed Mr. Whiston his deputy at Cambridge, with "the full profits of the place." Whiston began his astronomical lectures on the 27th January 1701 ; and when Newton resigned the chair on the 10th December 1701, he succeeded in getting Whiston appointed his successor. When he resigned his fellowship, which he did soon after, he stood tenth on the list ; and had he remained a fellow till August 1702, he would have been elected a senior.

We have not been able to discover why Newton did not represent the University in the Parliament which met in 1690. When a vacancy took place in November 1692, by the death of Sir Robert Sawyer, Newton's health would probably not permit him to aspire to the office. But at the next election for King William's sixth Parliament, he was chosen one of the members for the University. The other successful candidate was Mr. Henry Boyle, afterwards Lord Carleton ;¹ "so that on this occasion Trinity College had the honour of supplying the University with both its representatives, and Dr. Bentley had the satisfaction of assisting in the return of his illustrious friend."²

Newton's honours were now gathering thick around him. On the 30th November 1703, he was elected, on the retirement of Lord Somers, President of the Royal Society ; and he was annually re-elected during the remaining twenty-five years of his life, having held the office for a longer time than any of his predecessors, and longer too than any of his successors, excepting Sir Joseph Banks.

In this new position, Newton was brought into personal

early fostered and rewarded, while in England the Royal Society was left to struggle with poverty."—*History of the Royal Society*, vol. i pp. 355, 356. See vol. i p. 89, &c.

¹ Mr. Hammond was the opponent of Newton on this occasion. The votes stood thus—

Mr. Henry Boyle,	.	.	180
Mr. Newton,	.	.	161
Mr. Hammond,	.	.	64

² Monk's *Life of Bentley*, p. 122.

communication with Prince George of Denmark (the consort of Queen Anne), who had been elected a fellow of the Royal Society. The Prince was anxious to promote the interests of science, and, on Newton's recommendation, had offered to be at the expense of printing Flamsteed's observations, and particularly his catalogue of the stars. Newton's high merits then became known to the Queen, who resolved to take the first opportunity of showing her respect for his genius. In the month of April 1705, which her Majesty was spending at her royal residence of Newmarket, she went on the 16th, accompanied by Prince George of Denmark and her whole court, to visit the University of Cambridge, where she was to be the guest of Dr. Bentley, at Trinity Lodge. "Alighting at the Regent Walk," says Dr. Monk, "before the schools, she was received by the Duke of Somerset, the Chancellor, the head of the University, and addressed in a speech by Dr. Ayloffe, the public orator. From thence her Majesty went in procession to the Regent House, where, agreeably to ancient custom, was held the congregation of the senate, termed *Regia Comitia*, at which the University conferred degrees upon all persons nominated by the Royal command—the presence of the sovereign dispensing with statutable qualifications and exercises. Afterwards, the Queen held a court at Trinity Lodge, where she rendered this day memorable, by conferring knighthood upon the most illustrious of her subjects, Sir Isaac Newton.¹ A sumptuous dinner was then given to the royal visitor and her suite in the Hall of Trinity College, which had been newly fitted up and decorated. Whoever is acquainted with the large sums which *Alma Mater* has since expended on public objects, will be surprised to learn, that she was then so poor as to be com-

¹ The two persons who had the honour of being knighted along with Sir Isaac were Sir John Ellis, Master of Caius College and Vice-chancellor, and Sir James Montague, the University Counsel, afterwards Lord Chief Baron. Sir James, who was of Trinity College, was a younger brother of Lord Halifax, and, along with others, received on this occasion the degree of LL.D. At the same time the celebrated Dr. Arbuthnot, physician to the Queen, received the degree of M.D.

pelled to borrow £500 for the purpose of this entertainment. The royal party, after attending evening service, at the magnificent chapel at King's College, took leave of the University, and returned the same night to Newmarket."

It must have been at this period of Newton's life, that he wrote a love-letter, of which a copy was found among the Portsmouth papers; but we have no means of ascertaining whether it was for himself or a friend that he composed this remarkable epistle. It is in the handwriting of Mr. Conduitt, who, doubtless, intended to publish it, and is entitled, in the same hand, "Copy of a letter to Lady Norris, by ——," while on the back is written in another hand, "A Letter from Sir I. N. to ——." It has no date, but, as we shall presently see, it must have been written in 1703 or 1704:—

"MADAM,—Your ladyship's great grief at the loss of Sir William, shows that if he had returned safe home, your ladyship could have been glad to have lived still with a husband, and therefore your aversion at present from marrying again can proceed from nothing else than the memory of him whom you have lost. To be always thinking on the dead, is to live a melancholy life among sepulchres, and how much grief is an enemy to your health is very manifest by the sickness it brought when you received the first news of your widowhood: And can your ladyship resolve to spend the rest of your days in grief and sickness? Can you resolve to wear a widow's habit perpetually,—a habit which is less acceptable to company, a habit which will be always putting you in mind of your lost husband, and thereby promote your grief and indisposition till you leave it off. The proper remedy for all these mischiefs is a new husband, and whether your ladyship should admit of a proper remedy for such maladies, is a question which I hope will not need much time to consider of. Whether your ladyship should go constantly in the melancholy dress of a widow, or flourish once more among the ladies; whether you

should spend the rest of your days cheerfully or in sadness, in health or in sickness, are questions which need not much consideration to decide them. Besides that your ladyship will be better able to live according to your quality by the assistance of a husband than upon your own estate alone ; and therefore since your ladyship likes the person proposed, I doubt not but in a little time to have notice of your ladyship's inclinations to marry, at least that you will give him leave to discourse with you about it.

I am, Madam, your ladyship's most humble,
and most obedient servant."

The words at the close of this letter might lead us to suppose that the writer and the lover were different persons ; but as no name is mentioned, nor any reference made to the qualifications of a third party, it is probable that the title, "person proposed," is a quaint and not uncommon form of expression to avoid the use of the first person. It is not probable that any gentleman aspiring to Lady Norris's hand would intrust his cause to a friend, and still less probable is it that that friend would be Sir Isaac Newton. It could only have been for a very particular friend that Newton's modesty would have permitted him to undertake such a task, and not one of his acquaintances can be named who was unmarried, and who was likely to call in the aid of a philosopher in an affair of matrimony. Newton had been acquainted with Lady Norris for some years, and from the following letter to his niece, Miss Catherine Barton, which we found among his papers, there is some ground for supposing that he was then intimately acquainted with her :¹—

¹ This letter, which had on the back of it calculations about the Mint, is bound up near the beginning of the second volume of the large folio volumes containing papers about the Mint.

“ To Mrs. Catherine Barton,
at Mr. Gyre's at Pudlicot,
near Woodstock, in Oxfordshire.

LONDON, Aug. 5, 1700.

“ DEAR NIECE,—I had your two letters, and am glad the air agrees with you ; and though the fever is loth to leave you, yet I hope it abates, and that the remains of the small-pox are dropping off apace. Sir Joseph Tilley is leaving Mr. Toll's house, and it's probable I may succeed him. I intend to send you some wine by the next carrier, which I beg the favour of Mr. Gyre and his lady to accept. *My Lady Norris thinks you forget your promise to write her, and wants a letter from you.* Pray let me know by the next how your face is, and if the fever be going. Perhaps warm milk from the cow may help to abate it.—I am your very loving uncle,

“ IS. NEWTON.”

Lady Norris was the widow of Sir William Norris, Bart. of Speke, near Liverpool. Sir William took his degree of B.A. in 1679. He became one of the Lay-Fellows of Trinity College, and was succeeded in his Fellowship by Charles Montague. He sat for Liverpool in the third, fourth, and fifth parliaments of William III., in the proceedings of which he took an active part. He was created a baronet on the 3d December 1698, was minister at the Porte, and subsequently went out to Delhi as ambassador to the Great Mogul. Sir William arrived at the Mogul's camp, near Purnella, in April 1701, and appears to have conducted himself in “ an imprudent and expensive ” manner. The object of his mission seems to have been to solicit the favour of the Mogul to the English Company, in opposition to the London Company ; and it so far succeeded that the Mogul seized the property and servants of the last of these establishments. Sir William embarked on board the Scipio from Surat on the 29th of April 1702, and his brother, who was Secretary to the Embassy, went on board the China Merchant, one of the Company's ships, the cargo of which amounted to 60,000 rupees on the Company's

account, and 987,200 rupees on Sir William Norris's. The two vessels sailed for England on the 5th of May ; Sir William was seized with dysentery, and died on the 10th of October 1702, between the Mauritius and St. Helena, which the Scipio reached on the 31st October. Sir William left no family, and therefore his widow must have succeeded to his fortune.¹

Lady Norris, whose name was Elizabeth Read, was daughter and heiress of Robert Read of Bristol, and had been twice married before her union with Sir William, first to Isaac Meynell of Lombard Street, goldsmith, and, secondly, to Nicholas Pollexfen, a merchant in London.

As Mr. Norris resided at Trinity College while Newton held the Lucasian Chair, he must have been personally acquainted with him at that time, and their acquaintance must have been renewed when both of them had their residence in London. If our interpretation of the letter to Lady Norris be correct, the desire of Sir Isaac to marry at the age of sixty, has a remarkable coincidence with that of Leibnitz, who made proposals to a lady when he was fifty. "The lady," says Fontenelle, "asked for time to take the matter into consideration, and as Leibnitz thus obtained leisure to consider the matter again, he was never married."²

The Parliament had just been dissolved when Newton was knighted, and he seems to have been urged by his friends to stand for the University. He had visited Cambridge about a fortnight before, as Mr. Edleston supposes, on business connected with the election ; but it would appear from the following letter³ that he had no desire to contest the University again :—

"SIR,—I wrote lately to Mr. Vice-chancellor, that by reason of my present occasions here, I could very ill come down to

¹ See Bruce's *Annals of the Honourable East India Company*, vol. lii. pp. 261, 461, 472, &c.

² Fontenelle's *Eloge of Leibnitz*, *Mém. Acad. Par.* 1718, p. 126.

³ There is no address on this letter, of which I have found two rough copies.

your University to visit my friends in order to be chosen your burgess. I would have it understood that I do not refuse to serve you (I would not be so ungrateful to my Alma Mater, to whom I owe my education, nor so disobliging to my friends), but by reason of my business here I desist from soliciting, and without that, I see no reason to expect being chosen. And now I have served you in this Parliament, other gentlemen may expect their turn in the next. To solicit and miss for want of doing it sufficiently, would be a reflection upon me, and it's better to sit still. And tho' I reckon that all one as to desist absolutely, yet I leave you and the rest of the gentlemen to do with all manner of prudence what you think best for yourselves, and what pleases you shall please—Your most humble and most obedt. servant."

Although we might suppose from this letter that Newton was unwilling to canvass personally for a seat in the new Parliament, yet it appears from the following interesting communication to him from Lord Halifax, that he had resolved to be a candidate in the middle of March, and before the dissolution :¹—

"SIR,—I send you the address of the House of Lords, to which the Queen made so favourable an answer, that the enemy are quite enraged. The paragraph in her speech against the Tackers provokes them still more than this. And whatever the ministers may think, they will never forgive them for either. I believe they begin to think so, and will take measures to make other friends. I was in hopes by this post to have sent you an account of several alterations that would have pleased you, but they are not yet made, tho' you may expect to hear of them in a very little time. Among other expectations we have,

¹ This appears also from a letter of Flamsteed's written on the 5th April 1705, the day of the dissolution, in which he wishes Newton "good success in his affairs, health, and a happy return."—Baily's *Flamsteed*, p. 238. This letter (marked "not sent as he returned too soon") is given by Baily as probably addressed to Mr. Hodgson; but as Mr. Edleston first suggested, it was to Newton.—*Correspondence*, &c., p. lxxiii, note 151.

we do depend upon a good Bishop, Dr. Wake is likely to be the man. We are sure Sir William Dawes will not. I think this will have great influence in the place where you are, and therefore I think you may mention it among your friends as a thing very probable, tho' it be not actually settled. He is to hold St. James's in commendam, and Dr. Younger will be Dean of Exeter. Mr. Godolphin will go down to Cambridge next week, and if the Queen goes to Newmarket, and from thence to Cambridge, she will give you great assistance. The Tories say she makes that tour on purpose to turn Mr. Ansley out. He is so afraid of being thrown out, that Lord Gower has promised to bring him in at Preston, which they should know at Cambridge. If you have any commands for me, I desire you would send them to me, who shall be very ready to obey them.—I am your most humble, and most obedient servt.,

HALIFAX.

“17 March,” [1705.]

It appears from this letter that Newton had resolved to become a candidate. He seems, however, to have been very undecided, and very unwilling to take active steps in the matter, as appears from the following letter without a date and address.¹

“I understand that Mr. Patrick is putting in to be your representative in the next Parliament, and believe that Mr. Godolphin, my Lord High Treasurer's son, will also stand. I do not intend to oppose either of them, they being my friends, but being moved by some friends of very good note to write for myself, I beg the favour of you and the rest of my friends in the University to reserve a vote for me till I either write to you again, or make you a visit, which will be in a very short time, and you will thereby very much oblige yours, &c.”

Lord Halifax exerted his influence for Newton and Mr. Godolphin, as might have been expected, but, as the following

¹ This letter is among the MSS. of Newton, in the possession of the Rev. Jeffrey Ekins, who kindly communicated it to me. It was probably written shortly before his visit to Cambridge in March.

letter shows, anticipated their defeat from the opposition of the Court.

“SIR,—I have sent to my Lord Manchester to engage Mr. Gale for Mr. Godolphin, but I am afraid his letter will not come time enough. There can be no doubt of Lord Manchester’s sentiments in this affair. Mr. Gale may be sure he will oblige him and all his friends by appearing for Mr. Godolphin, and he can do you no good any other ways. I am sorry you mention nothing of the election. It does not look well, but I hope you still keep your resolution of not being disturbed at the event, since there has been no fault of yours in the management, and then there is no great matter in it. I could tell you more stories where the conduct of the Court has been the same, but complaining is to no purpose; and now the die is cast, we shall have a good Parliament.—I am your most humble and most obedient servant,

HALIFAX.

“5th May 1705.”

In order to promote his election, Newton went to Cambridge on the 24th or 25th of April. The Tory election cry on this occasion was “the Church in danger;” and, on the polling day, the 17th of May, “hundreds of young students hollowed, like schoolboys and porters, crying, No Fanatic, no occasional Conformity, against two worthy gentlemen that stood candidates.”¹ Newton and Godolphin were defeated, and Annesley and Windsor elected.² Mr. Mansfield mentioned to Mr. William Bankes, that his father, Sir James Mansfield, knew an old man at Cambridge who remembered this election, and who said that all the residents voted for Newton, but that they were outnumbered by the non-resident voters.

¹ Cobbett’s *Parliamentary History*, vol. vi. p. 496. Flamsteed thought Newton’s success doubtful, “by reason he put in too late.”—Baily’s *Flamsteed*, p. 239.

² The following was the state of the poll:—

Hon. Arthur Annesley,	(<i>Magd.</i>),	. . .	182
Hon. Dixie Windsor,	(<i>Trinity</i>),	. . .	170
Hon. Fra. Godolphin,	(<i>King’s</i>),	. . .	162
Sir Isaac Newton,	(<i>Trinity</i>),	. . .	117

Dr. Bentley voted for Sir Isaac.—Edleston’s *Correspondence*, &c., p. lxxiv., note 153.

CHAPTER XX.

Sir Isaac is anxious to have the Greenwich Observations published—Flamsteed agrees, provided his expenses are paid—Prince George offers to pay the expense of publishing them—He appoints Sir Isaac and others Referees to manage the matter—Articles agreed upon between Flamsteed and the Referees—Differences arise, and delays in Printing—The Prince offers to publish Tycho's Observations along with Flamsteed's—Newton writes to Olaus Roemer about Tycho's Manuscripts—To prevent delay the Referees propose to appoint another Corrector of the Press—Flamsteed opposes this in a Letter to Sir C. Wren—Prince George dies—The Work is stopped for three years—Flamsteed's Charges against Newton—Sanctioned by Mr. Baily—Defence of Newton—Flamsteed inserts in his Autobiography a false copy of his Letter to Wren—The Queen appoints a Board of Visitors to superintend the Observatory—Flamsteed's Correspondence with Dr. Arbuthnot—A scene between Newton and Flamsteed—Halley publishes the Observations printed at the expense of the Prince and the Public—Flamsteed publishes at his own expense the *Historia Celestis*—Observations on the Controversy.

ELEVATED to the Chair of the Royal Society, and enjoying the confidence of the Prince Consort, Sir Isaac had it in his power to do something for the promotion of Science. He had long cherished the desire of having the observations of Flamsteed published; and Halley and his other friends had frequently urged their publication with a degree of pertinacity which a personal interest in them could alone explain. It was a very natural wish on the part of physical astronomers to possess the best observations then made, by which they could test their speculations and their theories; and it was not an unreasonable expectation that the Astronomer-Royal, the author and the custodier of these observations, should impart such of them to his friends as their researches might require, and as his leisure would permit him to reduce. This, however, was a very different thing from the systematic publication of an

immense mass of observations accumulated by an astronomer who had a salary of only £100 per annum, and no allowance either for assistants or computers. Flamsteed had laid down a plan for reviewing the heavens, making a catalogue of the fixed stars, and instituting regular observations on the moon and the other planets. He again and again explained to Newton and others the reasons why he could not comply with their wishes, and, regardless of the clamours which were raised against him, and which he should have despised more than he did, he went steadily onward pursuing his own plan, till it was nearly ripe for execution.

In 1701 he had finished the greater number of the constellations, but it was not till the commencement of 1703 that his catalogue was so complete that he wished it to be made known, publicly, that he was ready and willing to publish it "at his own charge," provided the public would defray the expense "of copying his papers and books for the press." He had already employed calculators from the country, and made great progress in the preparation of his manuscripts, when Sir Isaac Newton paid him a visit on the 11th of April 1704. When dinner was over, Sir Isaac asked to see the state of his work, and, having been shown the catalogue of the fixed stars, the maps of the constellations, "his new lunar numbers fitted to his corrections," and the observations on the planets, he told Flamsteed that he would recommend them to the Prince *privately*. To this Flamsteed objected, and insisted that it should be done *publicly*;—a request which Newton did not seem to think reasonable.¹ In order to have a proper document for the Prince's consideration, Flamsteed found that the papers would occupy 1400 folio pages, and, having "drawn up an estimate of them," he sent them to the Royal Society, where it was proposed that the work should be "recommended to the Prince." Sir Isaac concurred in this opinion, and, on the 7th of December,

¹ An account of this interview by Flamsteed will be found in Baily's *Flamsteed*, pp. 69, 217.

he waited on the Prince, and gave him a copy of Flamsteed's estimate of his observations. The Prince lost no time in coming to a decision on the subject. After perusing the estimate, he intimated to Newton on the 11th, through his secretary, Sir George Clark, his persuasion of Flamsteed's fitness for the work, and desired that Newton, Mr. Robartes, Sir C. Wren, Dr. Gregory, Dr. Arbuthnot, and any other members of the Society Sir Isaac thought qualified, should consider what papers were fit for the press. Newton communicated this intelligence to Flamsteed on the 18th December 1704, and asked him to meet "the referees" at dinner next day, and bring his papers with him in the morning. Flamsteed attended the meeting; but as the referees had not time to examine the papers which he brought, Newton went to dine with him at the Observatory on the 29th, and made himself acquainted with the papers which it was proposed to publish. He accordingly, on the 23d January 1705, drew up the report of the referees, which was submitted to the Prince, and received his approbation.¹

During the rest of the year 1705, the printing of the work advanced slowly, on account of the ill health of the Astronomer-Royal, his distance from town, and differences of opinion which arose between him and Newton about the order of the observations. The Greenwich ones had been placed before the Derby ones, contrary to Sir Isaac's wishes; and, on the 25th of October, Flamsteed defends this arrangement, and adduces, as a sufficient warrant for his plan, that Albert Curtius, in publishing Tycho's Observations, began in 1582 with the most accurate. Along with this explanation he transmits the title of the work for Newton's approbation. The articles of agreement between Flamsteed and the referees were signed at

¹ In this Report, the original of which I have found in Sir Isaac's handwriting, the expense of printing 400 copies is £683, with £180 to pay the charges of two calculators, &c. "This set of observations," the reporters say, "we repute the fullest and completest that has ever yet been made, and as it leads to the perfection of astronomy and navigation, so, if it should be lost, the loss would be irreparable." The Report is published in Baily's *Flamsteed*, p. 234.

Newton's house on the 17th November 1705;¹ and in a day or two after their signature, we find Flamsteed writing to his friend, Mr. Sharp,² "that Newton had at last forced him to enter into articles for printing his works, with a bookseller, very disadvantageous to himself;" that "he has thereby injured him;" and that he does "not see that they are nearer the press than before."

The referees had found it necessary, as the dispensers of the Prince's bounty, and as acting for public interests, to draw up articles binding themselves, as well as Flamsteed and the printer, to perform their relative obligations. It is therefore of importance to know what these articles were, before we can rightly judge of the conduct of the parties. Mr. Baily has seen "four copies or draughts of these articles," so "similar to each other," that he "cannot ascertain *which* was the one actually agreed upon." He has overlooked the very title of these copies, and Flamsteed's note,³ written upon one of them, which prove that they are only articles *proposed* by Flamsteed,⁴ and not *the articles which he signed*. Of these he has left no copy, because he had wilfully violated them. From the very first he seems to have resolved not to perform his part of the agreement, and to have thrown difficulties in the way, in order to procure more money from the referees. After signing the second agreement, he followed the same course, lamenting constantly the hardness of his bargain, because he had made the instruments, and paid his assistants out of his own funds,—facts which had nothing whatever to do with the agreement,

¹ I have found three rough copies of these articles, all in Sir Isaac's handwriting, and obviously drawn up by himself. The very receipts granted by Flamsteed were written by Newton.

² November 20, 1705. Baily's *Flamsteed*, p. 256.

³ In this note he offers *immediately* to put the first volume into the hands of the referees.

⁴ Flamsteed says that he himself had drawn up articles which "were not to Newton's purpose;" and he refers to certain topics in "the articles," which are not mentioned in what Mr. Baily has ventured to consider as the genuine articles. See pages 80 and 81 of his *Autobiography*.

and which, though well known, were never pleaded before the agreement was made. He complains, too, in one place, that the £125 owing to him, was not paid till *above two months after* it was due ; and in another he says, “ it was *some months after* (March 20, 1707-8) ere I could get the £125 ; and I am apt to think, had it not been for Dr. Arbuthnot, I should never have received it.”¹ Now these statements he must have known to be false. I find by the agreement of the 20th March, that the £125 was due on the re-delivery of the Catalogue of stars to Sir Isaac, which took place on the 20th of March. The order upon Newton for the £125 was signed by the referees on the 26th March, and Flamsteed received his money on the 12th April !² It is strange how trivial writings are often preserved for the defence of innocence, and the establishment of truth.

I have not found a copy of the articles which were actually signed by the parties. I have before me, however, three drafts of them in Newton's handwriting, and I regret to say that they are essentially different from those published by Mr. Baily. In the latter, Flamsteed is brought under no obligation whatever, and he is made the custodier of all the copies of the work. In the former, he is brought under the most stringent obligation to produce “ fair and correct copies” of his Catalogue, and of all his other tables, within a specified time ; and there is no obligation to give him the custody of the printed work.³ The discovery of these drafts of the articles, which cannot be very different from those really signed, justifies the anticipation of Mr. Edleston, that they would throw light upon the controversy.

¹ Baily's *Flamsteed*, pp. 86 and 320.

² I have now before me the originals of the order upon Newton, of the 26th March, the order of Flamsteed of the 10th April, to pay the money to Mr. Hodgson, and Hodgson's receipt of the 12th April, all carefully preserved by Sir Isaac.

³ In Newton's drafts of these articles, two different modes of paying Flamsteed are mentioned. One of these provides that he shall receive £50 for copying and correcting the press of each volume ; and also 1s. 6d. per place, for computing the longitudes and latitudes of the planets, the places not exceeding 100, and the same sum for the places of the moon. The other mode is to pay two hundred and . . . pounds for both volumes.

Halley has distinctly stated, that it was agreed to prefix the Catalogue of stars to the first volume of the work ; and Mr. Baily, without any evidence, has denied this statement, and charged its author with many misrepresentations and misstatements. Flamsteed, indeed, has asserted that "he signed the articles, but *covenanted* that the Catalogue of the fixed stars *mentioned* to make a part of the first volume, should not be printed, but with the last ;" but this is an express declaration that the articles provided otherwise ; and Flamsteed's covenant had this strange character, that after signing articles, he either said to himself, or wrote upon the document, that he "covenanted" something different from them. In the articles of March 20, 1708, for example, after he had got a copy of them, he writes, "underneath it," that he covenanted certain things which the articles did not contain. In the draft of the original articles which I have mentioned, the contents of the two volumes are distinctly written in Newton's hand ; and it is not only stated in the contents, but it is the very first of the articles, that the first part of the first volume is to be the Catalogue of the fixed stars.¹

The allusion in Flamsteed's letter to the observations of Tycho, seems to have drawn the attention of the referees to that subject ; and they appear to have suggested to his Royal Highness the idea of having the unpublished observations of the Danish astronomer, which had been left in the King of Denmark's library, written in Tycho's own hand, printed at his expense, and published at the same time with Flamsteed's work. The Prince agreed to the suggestion ; and in communicating his secretary's letter to Newton, Dr. Arbuthnot, one of his Royal Highness's physicians,² requests him to inform the referees and Mr. Halley, but not to let Flamsteed know that Halley was

¹ This draft of the articles is given in APPENDIX, No. XIII.

² In an unpublished letter, dated Windsor, July 30, 1706. On the 8th of January 1707, Sir Isaac was requested by the Royal Society to endeavour to procure Tycho's MSS., to be printed with Mr. Flamsteed's observations, and on the 27th he stated that he would endeavour to procure them. Tycho's observations on the comets of 1585,

consulted. As the Prince was "mighty desirous to have the eight volumes of Tycho's observations in his possession," Dr. Arbuthnot suggested, that as they were sent into France by Olaus Roemer, the Danish astronomer, the referees should write to him, giving an account of the substance of Flamsteed's observations, and requesting an abstract of the eight volumes of those of Tycho. Sir Isaac accordingly drew up a letter in the name of the referees, and addressed it to Roemer; but whether or not it was sent, and what was the result of the application, if it was made, I have not been able to discover.

Notwithstanding these impediments, the first volume, containing the Sextant observations, was finished in December 1707; and preparations were made for printing the second volume, which was to contain the observations with the mural arc. On the 20th of March 1708, Flamsteed deposited the materials for this volume in the hands of the referees, copied out in 175 sheets of paper; and he soon after amended the catalogue which had been previously lodged in their hands under a new agreement.

At a meeting of the referees on the 13th July, it was agreed "that the press should go on without farther delay;" and "that if Mr. Flamsteed do not take care that the proofs be well corrected, and go on with dispatch, another corrector be employed." In order "to prevent the designed effect of this malicious order," Flamsteed wrote a long and temperate letter of remonstrance to Sir Christopher Wren, defending himself against the charge of delay, and protesting against anything being printed without his corrections. No answer was returned to this letter: The press was stopped; and before any arrangements could be made, Prince George died on the 28th October 1708, and the printing of the work was suspended for three years.¹

1590, and 1596, were given to the Royal Society by Newton, October 5, 1722.—*Miscellaneous MSS.* lvii.

¹ The agreement with the Prince was considered as cancelled by his death. His treasurer had advanced £375; and as £25 of this had not been expended, it was returned to his administrators. See APPENDIX, No. XV.

During this long interval, no communication passed between Flamsteed and any of the referees. Newton had in his possession the synopses of lunar observations which it is said were given him "with an express understanding that they were not to be published;" and also the uncompleted Catalogue of the stars, which, it is said, was sealed up at his own request. The obligation thus imposed, and the trust thus confided to him, he is charged with having violated. Had this charge appeared but in the letters and manuscripts in which it has slumbered for more than a century, few astronomers would have heard of it, and it might have been neutralized by the high character of the great and good man whose character it affected. But after being repeated in a variety of shapes, in the letters, and diary, and autobiography of its author, the calumny has been presented to the world in all its original bitterness, and in a more attractive form, by Mr. Baily; and the public money¹ has been expended in printing the volume which contains it, and in circulating it among all the distinguished astronomers and institutions throughout the world. I have felt it therefore a sacred duty to investigate the subject, and to defend an illustrious name, embalmed in the affections of his disciples and of his countrymen.

When Mr. Baily had seen the effect produced by his *Life of Flamsteed*, he found it necessary to publish a Supplement, in its explanation and defence; and from his preliminary observations, the reader will see the necessity of the task we have undertaken.

"It cannot be disguised," says Mr. Baily, "that the quarrel between Newton and Flamsteed, relative to the printing of the Greenwich observations, has arrested a much greater portion of the public attention than any other incident recorded in Flamsteed's *Life*, and indeed greater than its relative importance

¹ Mr. Baily's *Life of Flamsteed* was printed by order of the Lords Commissioners of the Admiralty in 1835, and copies of it presented by them to numerous individuals and institutions.

seems to merit ; and Newton's admirers have, as might have been expected, shown a natural desire to remove from him every appearance of misconduct arising out of that dispute. In doing this, however, it seems to me that, in some instances at least, the tendency of their remarks has been to exculpate Newton, not so much by a direct refutation of the charges adduced by Flamsteed, as by attempting to lower the moral and scientific character of Flamsteed himself in public opinion, and thus to show that Newton was most probably right in the line of conduct which he pursued. This course, however, can scarcely be tolerated at the present day : neither is it just to the character of Flamsteed (nor indeed to that of Newton, which stands too high in the general opinion of mankind to need such support), that the decision should rest on such grounds. The mere fact of mental superiority, which no one is disposed to deny, ought not to weigh one feather in the scale of justice, and the case must be decided solely on its own merits."

After this explanation, we may reasonably expect that the charge against Newton, when preferred by Mr. Baily, will be couched, as it is, in less exceptionable terms than in the vulgar and offensive phraseology of Flamsteed. We shall give it, therefore, in his own words, in order to make the charge and the answers to it perfectly intelligible.

"At the end of that period," says Mr. Baily (the interval of three years), "namely, in March 1710-11, Flamsteed learned, for the first time (no communication having been had with him on the subject during the interval), that this packet containing the Catalogue had been *broken open*, and that *not only* the Catalogue itself was at press, but also that the observations (copied out on the 175 sheets of paper as above-mentioned) were likewise in the course of being printed in a *garbled and mutilated state*.

"Flamsteed was of course *very much annoyed and irritated at this unexpected* piece of intelligence : he saw at once that

his favourite plan of printing his observations in detail in the order in which they were made, and the only way indeed in which they could be essentially useful to the future astronomer, was, *without his knowledge or consent*, about to be sacrificed to a scheme that would render them of little or no practical utility, and compromise his own character as an observer. He likewise found that the places of the moon, which he had from time to time communicated to Newton, with an express understanding that they were not to be published, because they were deduced from an imperfect catalogue of the stars, were annexed to the work. He was convinced that this scheme had been long in agitation, since it must have taken the referees a considerable time to dissect and arrange the observations in the manner in which they were then prepared and sent to the press.¹ Upon what grounds *this clandestine and improper conduct can be justified, I have ever been at a loss to imagine ; and I have always regretted* (in common I am sure with every other reader), *to find Newton's name mixed up with a transaction of this kind ;* since it is, in my opinion, the only portion of the series of disputes recorded in this volume that is worthy of a serious refutation ; all the other *sudden ebullitions of temper and apparent perversity of conduct* being mere venial offences of our common nature. But I suspect it was in that day as at the present hour, that individuals of high and honourable character (when acting in concert with others having interested objects in view, and not quite so scrupulously austere in their conduct as themselves) may sometimes be led to countenance and sanction certain acts which, as private persons, and on their sole responsibility, they would cautiously avoid."²

¹ "The same remark may perhaps be applied to the Catalogue ; and therefore Flamsteed's assertion that the Queen's order (to open the packet), if obtained at all, had been obtained after the offence was committed, is probably correct ; as that order would not have been given prior to February, and the Catalogue containing the additional stars by Halley, was at press in the following month, and actually finished by the month of June." See page 174.

² Baily's *Flamsteed*. Supplement, pp. 727, 728.

Had Mr. Baily told us how Flamsteed first heard of the ill usage and clandestine proceedings so forcibly described in the preceding passage, and *how he received the intelligence*, we should have been better able to form an opinion of the nature of the offence. The whole statement of Mr. Baily, that he was annoyed and irritated at the piece of *unexpected intelligence*, is an entire fiction. The intelligence was received in *March* with perfect composure of mind, and the alleged irritation was not shown till *October*, seven months afterwards, and then too, not at the intelligence, but during a personal altercation with Sir Isaac Newton, in which Flamsteed was the aggressor! This important fact is proved by the correspondence which was begun by Dr. Arbuthnot on the 14th March 1710-11, and continued till the 23d of May. The fact of the Catalogue being in the press, and consequently of the packet having been opened, if it ever was sealed, is obvious from the very first letters of Arbuthnot; and in the five answers returned by Flamsteed, there is not the slightest allusion made to the irritating event!¹

Mr. Baily asserts on Flamsteed's authority,² that it was in March 1711 that he first learned that the sealed Catalogue was broken open, but the incorrectness of this statement, which Mr. Baily ought to have known, is proved by the very letters of Flamsteed himself. In his petition to the Queen, April 16, 1712, he distinctly states that "some time after (March 1706), he was told that the copy of the Catalogue was *opened and unsealed*;" and in a letter to Sharp, May 15, 1711, he tells him, "we met on March 20, 1707-8 (the date of the

¹ Flamsteed tells us in his autobiography, written long afterwards, that in March 1711 he was "privately told that his Catalogue was in the press" (p. 93); and in his letter to Sharp, dated May 15, 1711, he says, "March 25th last past I was informed by a friend that my Catalogue was in the press, and some sheets of it printed off;" but this was no secret, for on the 21st February, at a meeting of the Royal Society, Dr. Sloane was ordered "to write a letter to him, desiring him to furnish the deficient part of his Catalogue of the Fixed Stars, *now printing by order of the Queen.*"

² Baily's *Flamsteed*, p. 93.

second agreement), and then Sir Isaac had *opened the Catalogue*, and desired me to insert the magnitude of the stars to their places, for they had not always been inserted in it." Now it is here placed beyond a doubt, that Flamsteed knew in March 1708, that the Catalogue was *open*—that he found no fault whatever with its being open, and did not *at the time* charge Newton with having opened it. Nay, he is so well pleased with this second agreement, and the payment to himself of £125, to which he had no claim by the original articles, that he tells Sharp, on the 19th April 1708, of this "*change in his affairs* which it will not be displeasing to him to hear," and he finds no fault with the Catalogue being open, though he adds that it was part of the new agreement that the magnitudes were to be inserted in it. In the whole of his correspondence with Sharp, the depository of his afflictions and his calumnies, from March 1708, when he knew that the Catalogue was opened, till the end of November 1712, he makes no charge against Newton or any other person for having unsealed the Catalogue. At that date, however, when the arrangement between him and the referees was at an end, he tells his correspondent for the first time that "he was forced to trust in the hands of Sir Isaac Newton an imperfect copy of the Catalogue, which he *very treacherously broke open*, though it was at his own desire *sealed up* and so delivered into his hands."¹

The next charge which Mr. Baily makes against Newton and his colleagues is, that *without Flamsteed's knowledge and consent* they sacrificed "his *favourite* plan of printing his observations in detail in the order in which they were made," to "a scheme of little or no practical utility, and compromising his character as an observer." To this charge it is sufficient to reply, that the scheme here condemned is that which forms the first article of the agreement signed by Flamsteed himself! Of the same character is the charge that, in "annexing to the

¹ Baily's *Flamsteed*, p. 298.

work" the places of the moon, Newton had violated an express understanding that they were not to be published. Now, Mr. Baily ought to have known that this understanding was imposed upon Newton in 1694, when he received these observations for his lunar theory. By the articles of agreement, these lunar observations were to form part of the *Historia Cœlestis*, and for the purposes of collation the referees were authorized to call for *all the original papers* in Flamsteed's custody. These observations, whether in Newton's possession or anywhere else, had thus become the property of the referees for publication, and they were guilty of no clandestine conduct in annexing them to the work. In a note, which we have not quoted, Mr. Baily says, "that no demand was ever made by the referees for any observations subsequent to the year 1705," whereas it is expressly stipulated in the first article, "that the observations made with the wall quadrant telescope and micrometer," shall be those "made in and after 1689, *until the finishing of the impression!*"

After making these injurious attacks upon Newton, which we trust have been satisfactorily repelled, Mr. Baily "imagines that it may now be left to the candid and unbiassed judgment of the public to decide whether there is the slightest foundation for the opinion that Flamsteed opposed any impediment to the publication of his astronomical observations, or whether, on the other hand, Newton exhibited any great anxiety for their speedy appearance, in order to complete his Theory of Gravitation." A brief notice of the conduct of the two parties thus placed at the bar of the public, will enable it to give the unbiassed decision which Mr. Baily solicits.

Previous to the 10th of April 1704,¹ the Prince, whose "help to print had been craved by Flamsteed,"² had expressed a willingness to bear *the expense of printing* his Observations. At the above date, Newton saw the Book of Observations, the Catalogue, so far as finished, and the Maps of the Constellations;

¹ Baily's *Flamsteed*, pp. 73 and 219.

² *Ibid.* p. 76.

and an estimate by Flamsteed of the number of pages or extent of the work was laid before the Royal Society, who recommended the publication of it. The referees appointed by the Prince inspected the papers, and on the 23d January 1705, they reported that the expense of printing 1200 pages, "all which was ready for the press," would be £683, including £100 for copying the papers and correcting the press. At the end of the report, the referees observe, "that it *may be very proper* to print the places of the moon, planets, and comets, 600 being computed, and 1400 not, and that the charges of two calculators to finish them, and of paper, press-work, and printing, will be about £180; so that the whole charge will be about £863."¹

It will be seen from these arrangements, that the idea of Flamsteed's receiving any recompense for his own labours was never contemplated by the Prince or the referees; but in about a month after the date of the report, he suggested to Newton that he should have *an honourable recompense for his pains*.² No notice being taken of the suggestion, he again, on the 15th June 1705, complains that on that occasion Newton did not say *a word of any recompense for thirty years' pains*, though he said *it would be for the committee's honour to provide for that first*; and, on the 29th August 1705, he pronounces it "extremely unjust that no care should be taken to secure him the reimbursement of his large expenses for above thirty years,"

¹ It is here important to notice that the printing of the places of the planets, &c., is not a *necessary* part of the arrangement, and that if it is thought proper to adopt it, it is to be paid for by a separate sum. In two copies of this report, found among Flamsteed's MSS., this £180 is not mentioned.—Bailly's *Flamsteed*, p. 76, note. But in giving in his autobiography a copy of the estimated expense, Flamsteed not only inserts the £180 along with the other sums, but he gives it as the sum to be paid for *two calculators*, thus making it appear that £280 out of the £863 is to be at his disposal. After his statement of the charges of printing, &c., Flamsteed adds, "But the last particular of the charge (£180 for two calculators) was not mentioned in it (the Report), but added in a note *under it*, for what reason those know best who drew it up." The Report states distinctly the *reason*. It is strange that an editor like Mr. Bailly, who has given the *real* Report as possessed by Flamsteed, should have allowed these misstatements to pass un-reproved.

² Feb. 28, 1705.

adding, "that it was a great dishonour to the Queen, the Prince, and the nation, that no reward was proposed."

Previous to these expressions of his views,¹ Flamsteed had communicated, in a letter to his nephew, Mr. Hodgson, a plan of doubtful honesty, for making money out of the "Prince's Bounty"—a plan which he never could have meant for the public eye, and which Mr. Baily ought not to have published.² It is obvious, indeed, that before and after he had signed the articles in 1705, the grand object of the Queen's Astronomer was to secure a sum of money for himself, and that to obtain this he threw every obstruction in the way of completing the work.

On the 13th July 1708, nearly *three years* after the work had begun, and when it ought to have been finished, the delay on Flamsteed's part was so great, that the referees, as we have previously stated, agreed, that if he "did not go on with despatch, another corrector would be employed."

In order to thwart this resolution, Flamsteed immediately addressed a letter to Sir Christopher Wren,³ in which he lays the whole of the blame upon Newton; and, in order to give authenticity to the copy of it which he preserved, he tells us that "he took a copy of it himself to show any acquaintance, friends, and some gentlemen that had an opinion of Sir Isaac Newton before, and could not think he could be guilty of such collusion as this order and my letter proved upon him."⁴ This

¹ March 22, 1705.

² "I think to be very plain with Mr. Aston, and desire that he, I, and Mr. Churchill, may understand one another fully, and know what each shall advantage themselves by my pains; for his and Mr. Churchill's will be little or nothing, but to accept their shares, and this will be no equal bargain for me that must be at all the labour and trouble here, nor for Mr. Newton, who saves us the labour of soliciting for the Prince's bounty at Court. And therefore I think he too ought to be acquainted with what advantage every one of us shall make, and go and share with us. I shall say this to him when he returns from Cambridge."—March 22, 1705. It may be conjectured, from the postscript to this letter, that the parties were, according to this plan, to divide the profits arising from the sale of the 400 copies of the work.

³ Dated July 19, 1708, and sent by Wren to Newton.

⁴ Baily's *Flamsteed*, p. 87.

copy, which exists in Flamsteed's handwriting,¹ was transferred to his autobiography for the avowed purpose of proving Newton's guilt, and correcting the good opinion entertained of him by the friends of the Queen's Astronomer and others. The letter certainly has not such a tendency, but in order to give it efficacy, Flamsteed cancelled a paragraph in the original sent to Wren, and substituted another in the incorrect copy, which he submitted as evidence to the contemporary jury that was to try Newton, and to the more solemn judgment of posterity. Sir Isaac had fortunately preserved the original letter, which, after slumbering for a century and a half, and eluding the search of Mr. Baily, has reappeared to defend Newton, and cast a doubt on every document Flamsteed left behind him that is not authenticated by other evidence than his own.²

In the original, or cancelled paragraph, Flamsteed declares his willingness, and even his desire, to finish the work. He instructs his nephew to correct the proofs: He leaves six sheets to be added: He authorizes Newton to go on with the 175 sheets of the second volume, that the press may proceed while he is completing the Catalogue, so that there should be no stop on his account, as there never was, and never should be.³ Nothing could be more satisfactory to the referees than this communication. Whatever misunderstandings had occurred, the Queen's Astronomer here bound himself anew to complete the Catalogue, and avoid all further delay; but after the Prince's death, when he had refused to complete the Catalogue, and, in 1716, when he came to write his autobiography, he was willing to forget the obligations in the original paragraph, and he therefore falsified the document by the substitution of a paragraph in which he abjures hurrying on the work in his absence, and limits his former promise, that there shall be no stop on his account, by the condition that "heed should be

¹ Baily's *Flamsteed*, p. 87, note.

² See pages 121, note; 128, note; and 129, note.

³ This paragraph, and the one substituted for it, are given in APPENDIX, No. XIV.

given to his advice ;” or, in other words, that he should have his own way, which he took in spite of all his written promises and sealed obligations.¹

Previous to Flamsteed’s correspondence with Arbuthnot, the Royal Society, anxious to make the Greenwich Observatory useful for the promotion of astronomy and navigation, applied to the Queen to place it under the superintendence of a Board. An order was accordingly issued on the 12th December 1710, appointing the President, and such other members of the Royal Society as it should name, to suggest observations to be made, —to repair and renew the instruments in the Observatory, and to receive from the Astronomer-Royal the annual observations which he has recorded. Armed with this authority, and by an order from the Queen to print the observations, in the hands of the referees, the Society requested Dr. Arbuthnot to apply to Flamsteed, as we have seen he did, in March 1711, for the rest of his Catalogue, the part of it in their hands having been already in the press. The sheets were sent to Flamsteed, who asserted that they contained many errors and unnecessary alterations, while Halley² declared that he had corrected numerous errors

¹ Nearly three years after this letter to Wren was written, on the 26th April 1711, Flamsteed desired Dr. Arbuthnot “to peruse his letter to Sir C. Wren, of which he had given him a copy, and *particularly the last paragraph*, whereby he would be satisfied that he had done all that lay in his power to expedite his work, and *had taken great care of the Catalogue of the fixed stars.*” Now it is only in the original letter actually sent to Wren that these matters occur in the last paragraph, so that Flamsteed referred to the real letter, of which he had taken a *correct* copy for Arbuthnot. The incorrect copy was, therefore, manufactured at a later date for the purposes we have mentioned.

² This letter of Halley’s to Flamsteed, dated June 23, 1711, is the only appearance he makes in person in this multifarious correspondence. When we consider the innumerable and coarse attacks made upon his character, and the vulgar abuse of him which almost every letter contains, the following advice to Flamsteed at the close of his epistle will not be thought unfriendly :—“Pray govern your passion, and when you have seen and considered what I have done for you, you may perhaps think I deserve at your hands a much better treatment than you have for a long time been pleased to bestow on your quondam friend, and not yet profligate enemy (as you call me).” This advice is not so severe as that of Flamsteed’s own particular friend Dr. Smith. “My advice is, that you represent your case nakedly, clearly, and without any flourish, or without any kind of resentment, as you are a philosopher and a mathematician, *and above all, as you are a clergyman.*”—Bailey’s *Flamsteed*, pp. 293 and 747.

in the original Catalogue—that he had asked Flamsteed for any corrections he thought necessary, and that he offered to make them and reprint the whole sheet if required.¹

While matters were in this state, Sir Isaac requested Flamsteed to meet him at the Royal Society's house on the 26th October 1711. Flamsteed accordingly went, and found there Dr. Sloane and Dr. Mead along with Newton. Flamsteed has given *three*² accounts of this meeting, which are not very consistent with one another. According to him, Newton asked what instruments he wanted, and what repairs. Upon which Flamsteed said that he would not suffer any one to concern themselves about repairing his own instruments. To this Newton replied, "As good have no observatory as no instruments." Flamsteed then complained that he had been *robbed of the fruit of his labours*. "At this," says Flamsteed, "the impetuous man grew outrageous, and said, 'We are then robbers of your labours?' I answered, 'I was sorry that they owned themselves to be so.' After which all he said was in a rage. He called me many hard names—*puppy* was the most innocent of them."

Such is Flamsteed's account of an altercation which he did not make known at the time it happened, in order to allow the other three parties concerned to give their account of what actually took place. We have Flamsteed's own authority for stating that Dr. Mead ran into the same passion, and charged him with having insulted the President. If it be true that Newton lost his temper and called Flamsteed a puppy, we leave it to those who have perused the correspondence, and studied the character of Flamsteed as gathered from the preceding pages, to determine the amount of provocation which Newton seems to have received. How simple-minded must he have been in

¹ On the 18th March 1712, when Halley visited the Observatory, "He offered," says Flamsteed, "to burn his Catalogue if I would print mine." Dr. Arbuthnot had previously offered to "reprint, change, or alter anything Flamsteed allowed."

² In his Autobiography and Diary, and in a letter to Sharp.

whose vocabulary of vituperation the epithet given to Flamsteed was the most prominent !

The referees, by orders from the Queen, proceeded to print the copy of the Catalogue when they could procure no other, and therefore they, and not Newton, must have broken open the seal if it was sealed. In violation of the promise contained in his letter to Wren, Flamsteed had refused to go on with it, and we find him telling Sharp, what he durst not insinuate to the referees, that "*he shall not urge the press forward again till he sees a good fund settled and secured.*"¹ No sooner, however, does he find that his Catalogue is printing, and that the *press is urged forward* by the referees, than he assails them with the most violent language. Halley is called a *malicious* thief. His property, which he gave to Newton, and got money for it, is said to have been surreptitiously forced out of his hands by his profligate enemies, and under the influence of these feelings he determined to print his observations at his own expense, thus violating two solemn obligations, and frustrating the liberal arrangements of Prince George, after he had received £125 of his money, and caused £250 more to be expended in printing the work, and in paying Machin for correcting his own calculations.

Under these circumstances the referees, with the assistance of Dr. Halley as its editor, published in 1712, under the title of *Historia Cœlestis*, the part of the work which had been executed at the expense of the Prince and the Government.² Of the 400 copies that were printed, nearly 100, including 30 reserved by the Treasury, were presented to eminent individuals and public bodies, and the remaining 300 were given to Flamsteed by Sir Robert Walpole, when First Lord of the Treasury. Flamsteed committed them to the flames, preserving only what is now the first 97 sheets of the *Historia Cœlestis*, which he left

¹ Baily's *Flamsteed*, p. 270; March 24, 1709.

² In APPENDIX No. XV., I have given an account of the expense incurred by the Prince and the Government in printing the work.

almost ready for publication at the time of his death, on the 31st December 1719. The work was published in 1725 by his executors, in three vols. folio, and dedicated by them to the King.¹

In taking a general view of this painful controversy, Mr. Baily has remarked, that the friends of Newton have defended him by attempting to lower the moral and scientific character of Flamsteed ;² a course which he thinks can scarcely be toler-

¹ The correspondence between Newton and Flamsteed seems to have terminated with Flamsteed's letter of September 14, 1706. I have found, however, among the Portsmouth papers, a draft of a letter from Newton to Flamsteed, without a date, and certainly written about the 24th of March 1711. It shows his great anxiety to get on with the printing of the work, in place of stopping it, as Flamsteed maintained. It will be found in APPENDIX, No. XVI. There is also a short one from Flamsteed, dated April 23, 1716, wishing Newton to return some of his manuscripts.

It may be proper here to notice an observation made by Professor De Morgan, in reference to the omission of Flamsteed's name from the second edition of the *Principia*. "Shortly afterwards," he says, "the second edition of the *Principia* appeared. Flamsteed, whose observations had been of more service to Newton than those of any other individual, and to whom proper acknowledgment had been made in the first edition, and who had increased the obligation in the interval, had his name erased in all the passages in which it appeared (we have verified for this occasion eight or nine places ourselves). To such a pitch is this petty resentment carried, that whereas in one place of the first edition (prop. 18, book iii.) there is in a parenthesis 'by the observations of Cassini and Flamsteed,' the corresponding place of the second is 'by the consent of the observations of astronomers.'"—*Sketch of the Life of Newton, Cabinet Portrait Gallery*, vol. xi. p. 101. Lond. 1846. In reply to this statement, Mr. Edleston observes, "The name, however, will be found in pages 441, 443, 445, 458, 465, 478, and 479: The last two references occur in some additional matter on comets, which was put into Cotes's hand in October 1712. (See p 141 of this work.) I question very much whether the suppression of Flamsteed's name in several places where it had appeared in the first edition, was not such as was necessary in the process of improving the work."—*Correspondence*, &c. p. lxxv., note 162. In thus correcting the numerical oversight of Professor De Morgan, we must admit that his criticism is substantially correct. Mr. Edleston's explanation is not applicable to the omission of the joint names of Cassini and Flamsteed; but even if it had an application to them, it would not justify the omission. Newton owed to Flamsteed substantial obligations, and we do not think that these obligations are sufficiently acknowledged in the *Principia*, even if his name had in every case been retained in the second edition.

² The following opinion of the *Principia*, given by Flamsteed in 1713, might have either justified an attempt on the part of Newton's friends, to lower his scientific character, or rendered it unnecessary. "I think his new *Principia* worse than the old, save in the moon!"—Baily's *Flamsteed*, p. 307.

ated in the present day. Attainments in science have certainly nothing to do with the present question ; but after Flamsteed has charged Newton with illegal, unjust, and immoral acts, upon no evidence but his own, and has sullied that venerable name with vulgar and offensive abuse,—it is a strange position to maintain, that we are not to inquire into the temper and character of the accuser.¹ In the revolting correspondence which Flamsteed has bequeathed to posterity, he has delineated his own character in sharp outline and glaring tints ; and Newton requires no other *Ægis* to defend him than one whose compartments are emblazoned with the scurrilous invectives against himself, and garnished with pious appeals to God and to Providence. We have hesitated, however, to associate the sacred character of the accuser with systematic calumny ; and we hasten to forget that there may be an astronomer without principle, and a divine without charity.

¹ The injurious tendency of Mr. Baily's work is strikingly exhibited in the notices of it in our two leading reviews. Both the *Edinburgh* and the *Quarterly Review* took the part of Flamsteed, and made no attempt to defend Newton against his charges. It never seems to have occurred to the writers of these articles, that the charges are supported by no other evidence than that of the choleric individual by whom they are preferred ; and neither of them has been at the trouble of cross-questioning their solitary witness. The *Quarterly Reviewer* goes so far, as "charitably to attribute Newton's letter of the 6th of January 1699, to the effect of that distressing malady which overwhelmed Newton for a time in 1692—a malady rashly ascribed by some to mental aberration!"—See *Edinburgh Review*, vol. lxii. p. 359, June 1836 ; and *Quarterly Review*, vol. lv. p. 96, December 1835.

CHAPTER XXI.

Dissensions in the Royal Society—Dr. Sloane and Dr. Woodward—Letter to Newton on the subject—Dr. Woodward removed from the Council—Second edition of the *Principia*—Dr. Bentley's letter to Newton about it—Delay of the work—Bentley's second letter—Newton's residences in London—Bentley announces to Newton the completion of the second edition—The Duke D'Aumont elected F.R.S.—Deslandes' account of a dinner party at Newton's—Origin of the Royal Observatory at Greenwich—Prince Menzikoff elected F.R.S.—Petition to Parliament for a Bill to promote the discovery of the Longitude—Evidence of Newton—His conduct misrepresented by Whiston and Biot—The Bill passes both Houses of Parliament—Dissensions in the Government—Offer of a pension to Newton—Death of Queen Anne—Accession of George I.—Lord Halifax Prime Minister—Death of Halifax—His will—His affection for Miss Catherine Barton, Newton's niece—Her intimacy with Swift—Her character defended.

WHILE Sir Isaac and his friends were striving with Flamsteed to complete the printing of the Greenwich Observations, his tranquillity was disturbed by an exciting dispute which took place in the Council of the Royal Society, between Dr. Sloane and Dr. Woodward. So early as 1700, before Newton was President of that body, the conduct of its Secretary, Dr. Sloane, in furnishing "unfit entertainment" at their meetings, and in conducting the publication of the *Philosophical Transactions*, had been the subject of animadversion. In a pamphlet, entitled *The Transactioneer, with some of his Philosophical Fancies*, the Royal Society, and particularly Dr. Sloane, were severely satirized. The Council made great exertions to discover the author of this silly production,¹ "and Dr. Sloane, and his friend Mr.

¹ Dr. Johnson says that it was written in 1700 by Dr. William King, "a man of shallowness;" and Mr. Weld, who has looked into the copy of it in the British Museum, characterizes it as "of so low and ridiculous a nature, that it is surprising the Council

Pettiver, caused it to be set abroad, that Dr. Woodward was either the author, or at least concerned in its production." Dr. Woodward indignantly denied the charge. "I am sorry," he says, "to find two or three members of the Society, and my particular friends, ill treated in it: The writer of it is but meanly qualified for what he undertakes; though whether there was not occasion given, may be worth your consideration. This I am sure, the world has been now for some time past very loud upon that subject: and there were those who laid the charges so much wrong, that I have but too often occasion to vindicate the Society itself, and that in public company too." This homologation of the charges in the pamphlet, by a distinguished member of the body, could not fail to irritate the Secretary; and we need not wonder that a more public quarrel arose between Dr. Woodward and Dr. Sloane. At the anniversary meeting of the Society held on the 30th November 1709, Dr. Sloane was re-elected to the office of Secretary; and Mr. Richard Waller, who had been the other Secretary since 1687, was replaced by the Rev. John Harris, D.D., a friend of Dr. Woodward and his party.¹ Soon after this election, and at one of its ordinary meetings,² Dr. Sloane "entertained" the Society with a translation from the Memoirs of the Academy of Sciences, in which it was "maintained *that the Bezoar is a gall stone,*" and the Doctor himself asserted "*that the stones in the gall-bladder were the cause of colic.*" Dr. Woodward denied the truth and probability of these opinions; and when his adversary "was not able to maintain what he had asserted by words, he had recourse to grimaces very strange and surprising, and such as were enough to provoke any ingenuous sensible man to a warmth at least equal to that which Dr. Woodward

should have thought it worth their while to notice it."—*History of the Royal Society*, vol. i. pp. 352-355.

¹ Mr. Waller was reinstated in place of Dr. Harris at the next election on the 30th November 1710.

² The following account of the quarrel I find in an anonymous letter addressed to Sir Isaac Newton, and dated March 28, 1710.

used. His words were, *no man that understands anatomy, can assert that the stones in the gall-bladder are the cause of the colic.* When Dr. Sloane averred that all medical writers were of that opinion, Dr. Woodward replied, *none, unless the writer of the History of Jamaica*; challenging him to assign any one man, which he did not. But appealing to Dr. Mead,—which was only a small mean shift, the Doctor was forced to give it against him. Those recited were the very words Dr. Woodward used; and whether they are unfit, you are a proper judge. That they were not spoken till after Dr. Sloane had made his grimaces twice or thrice, you were assured by Mr. Clavel, and Mr. Knight is ready to confirm the same if you please to ask him. He is a gentleman, as modest, impartial, and creditable, and indeed, with Mr. Clavel and Dr. Harris,¹ sate so fronting Dr. Sloane, as to be able to see his face and grimaces. The rest, which were but few, sate out of fair view. In particular, Mr. Moreland, that with so much solemn formality, made asseveration, that to the very best of his memory the words preceded the grimaces, sate directly behind Dr. Sloane, so that he neither did, nor possibly could, see one of those grimaces.”

In defence of the language used by Woodward, the author of this letter reminds Sir Isaac, that he himself had on a previous occasion employed still stronger terms against Sloane. “You had complained,” he says, “of Dr. Sloane’s artifices in surprising you with things at the Council, frequently very unfit, without having given you any previous account. As upon others, you had declared to more than one friend, how little qualified he was for the post of Secretary, so upon these occasions you as freely declared him *a tricking fellow*; nay, *a villain and rascal*,²

¹ Dr. Harris was the author of a work published in 1697, in defence of Woodward’s “*Essay towards a Natural History of the Earth.*” It was entitled, “*Remarks on some Late Papers, relating to the Universal Deluge, and to the Natural History of the Earth.*” —Ward’s *Lives of the Gresham Professors*, p. 286.

² Without better evidence than that of a partisan, we cannot believe that these words were in Newton’s vocabulary. When he was irritated at the conduct of Flamsteed, he could not command a harsher term than that of *Puppy*. See p. 180. The letter, how-

for his deceitful and ill usage of you in the affair of Dr. Wall. Such expressions do not fall forth of the mouth of a gentleman of your truly good sense and breeding, without cause. Indeed, all allow you had very great and just cause; and though Dr. Woodward has not used any such expressions, he has had causes as great and just, long and often, of which I have heard the particulars, but shall not trouble you with them here."

This appeal to Sir Isaac does not seem to have advanced the objects of Dr. Woodward and his party. The grimaces of Sloane, and the uncivil language of Woodward, were brought under the notice of the Council on the 10th of May 1710. Sloane denied the grimaces, and in such a way as to induce Woodward to say, "Speak sense, or English, and we shall understand you." The consideration of this new attack upon the Secretary came before the Council on 24th May; and as the Doctor refused to make an apology, it was resolved, "that Dr. Woodward be removed from the Council for creating a disturbance by the said reflecting words." A resolution was, at the same time, passed, thanking Dr. Sloane for his pains and fidelity in serving the Society as Secretary. Dr. Woodward brought an action at law against the Council in order to reinstate him as a member of it, but he was unsuccessful. Dr. Sloane resigned the office of Secretary in 1713, and on the 30th November 1727, he re-appeared in the Council with the rank of a baronet,—in the more dignified position of its President, and the successor of Sir Isaac Newton.¹

ever, is well written, and contains many useful and temperate suggestions for improving the Society. The author, too, seems not at all disposed to maintain his incognito, as he expresses a willingness to have a personal interview with Sir Isaac.

¹ Sir Hans Sloane and Dr. Woodward were both of them distinguished men, and great national benefactors. Dr. Woodward was Professor of Physic in Gresham College. He not only collected much valuable information respecting the geological structure of the earth, but so early as 1695, he began to form a collection of fossils, which after arranging and cataloguing it, he bequeathed to the University of Cambridge, of which he was a member, with the sum of £150, "for the maintenance of a lecturer to read there on the subject of the Doctor's Natural History of the Earth," &c. He was born May 1, 1665, and died April 25, 1728. His expulsion from the Council of the Royal Society

We have already seen, in the history of the *Principia*,¹ that Newton had been occupied during many years in preparing for the press a second edition of the work. His disputes with Flamsteed, however, and his duties at the Mint, rendered more anxious by the disturbances which had arisen in that establishment, interfered greatly with its progress; and it was with much difficulty that Dr. Bentley persuaded him to intrust the publication to him. He accordingly sent him, in June 1708, or earlier, a portion of the copy of the work, with his corrections and additions; and on the 10th of that month Bentley sent him a proof of the first sheet for his approbation, accompanied with the following letter:—

“TRIN. COL., June 10, 1708.

“DEAR SIR,—By this time I hope you have made some progress towards finishing your great work, which is now ex-

does not seem to have alienated him from Newton, as in 1714 he dedicated to him his *Naturalis Historia Telluris*, of which he says, “It is wholly owing to you, it being begun, carried on, and finished at your request.”—*Fossils of all Kinds*, 1728. Letter I.

Sir Hans Sloane, who was of Scotch extraction, was born in Ireland on the 16th April 1660. In the year 1705, he published the first volume of his *Natural History of Jamaica*, and the second volume in 1725. He wrote also twenty-four Papers for the *Phil. Transactions*. He was created a Baronet in 1716, and died on the 11th January 1753. On the condition of his family receiving £20,000, he bequeathed his museum to the public, with his library of 50,000 volumes, and 3566 manuscripts. The original cost of his museum was £50,000. Parliament accepted the trust, and these valuable collections form the nucleus of the British Museum.—Weld's *History of the Royal Society*, vol. i. p. 456.

During the time of the dispute, however, in the Royal Society, Newton is said to have remarked, “that Dr. Woodward might be a good natural philosopher, but that he was not a good moral one.”

In consequence of some difference of opinion on medical subjects, Woodward and Dr. Mead fought a duel under the gate of Gresham College. Woodward's foot slipped, and he fell. “Take your life,” exclaimed Mead: “Anything,” replied Woodward, “but your physic.” An amusing account of this duel, by Dr. Woodward, will be found in the *Weekly Journal* of June 20, 1719, and in Nichol's *Literary Anecdotes of the Eighteenth Century*, vol. vi. p. 641.

In writing to Abraham Sharp on the 14th July 1710, Flamsteed says, “Sir Isaac Newton has hurt our Royal Society by his partiality for E. Halley and Dr. Sioane, upon a small and inconsiderable occasion; so that they have broke up some few weeks before their time. Dr. Harris has lost all his reputation by actions not fit for me to tell you.”—Baily's *Flamsteed*, p. 276, note.

¹ See vol. i. p. 273.

pected here with great impatience, and the prospect of it has already lowered the price of the former edition above half of what it once was. I have here sent you a specimen of the first sheet, of which I printed about a quire ; so that the whole will not be wrought off before it have your approbation. I bought this week a hundred reams of this paper you see ; it being impossible to have got so good in a year or two (for it comes from Geneva), if I had not taken this opportunity with my friend Sir Theodore Jansen, the great paper merchant of Britain. I hope you will like it, and the letter too, which upon trials we found here to be more suitable to the volume than a greater, and more pleasant to the eye. I have sent you likewise the proof-sheet, that you may see what changes of pointing, putting letters, capitals, &c., I have made ; and I hope much to the better. This proof-sheet was printed from your former edition, adjusted by your own corrections and additions. The alterations afterwards are mine, which will show and justify themselves, if you compare nicely the proof-sheet with the finished one. The old one was without a running title upon each page, which is deformed. The sections only made with Def. 1. Def. 2., which are now made full and in capitals—DEFINITIO I., &c. Pray look on Hugenius de Oscillatione, which is a book very masterly printed, and you'll see that it is done like this. Compare any period of the old and new, and you'll discern in the letter, by the change in the points and capitals, a clearness and emphasis that the other has not ; as all that have seen this specimen acknowledge. Our English compositors are ignorant, and print Latin books as they are used to do English ones, if they are not set right by one used to observe the beauties of the best printing abroad. In a few places I have taken the liberty to change some words, either for the sake of the Latin, or the thought itself ; as that in page 4, *motrices, acceleratrices et absolutas*, I placed so, because you explain them afterwards in that order.

“ But all these alterations are submitted to your better judg-

ment ; nothing being to be wrought off finally without your approbation. I hope to see you in about a fortnight, and by that time you will have examined this proof, and thought of what's to come next. My wife has brought me a son lately, who, I thank God, is a true healthful child.—I am, yours,

“ R^I. BENTLEY.

“ Note that the print will look much better when a book is bound and beaten.”

I have not been able to discover any reason why the printing of the second edition, thus fairly begun, and for which paper was purchased, should have been discontinued, and why the duty of editing it had passed from the hands of Bentley into those of Cotes.

Newton was at this time occupied as one of the referees with the publication of the Greenwich Observations, and with his business in the Mint and at the Royal Society ; and we may ascribe, as Mr. Edleston has done, the delay which took place, when the assistance of Cotes had been obtained in 1709, to the political excitement of the times, and to the occupation of Bentley with his quarrels with the seniors of his College.

It does not appear at what date Mr. Whiston delivered to Cotes “ the greatest part of the copy of the *Principia*.” Newton intimates the transmission of it, in a letter dated October 11, 1709. Cotes was then in the country, where he had been for about a month, and Newton's letter to him was acknowledged by Bentley on the 20th in the following terms :—

“ TRIN. COLL., Octob. 20, 1709.

“ DEAR SIR,—Mr. Cotes, who had been in the country for about a month, returned hither the very day Dr. Clarke¹ brought your letter, in which, I perceive, you think we have

¹ Dr. Clarke had probably come up to perform some exercises for the degree of D.D. which he took in 1710.

not yet begun your book ; but I must acquaint you that five sheets are finely printed off already, and had not we staid for two cuts that Rowley carried to town to be mended by Lightbody, which we have not yet received, you had had sent you six sheets by this time. I am sure you'll be pleased with them when you see them. Besides the general running title at the head of every leaf, PHILOSOPHÆ NATURALIS PRINCIPIA MATHEMATICA, I have added the subdivisions of the book (like Hugonii de Oscillatione), first, DEFINITIONES, then AXIOMATA SIVE LEGES MOTUS, then DE MOTU CORPORUM LIBER PRIMUS. Next will come SECUNDUS, and lastly, DE MUNDI SYSTEMATE LIBER TERTIUS. All these stand in the top of the margin of the several leaves. Your new corollary, which you would have inserted, came just in time, for we had printed to the fiftieth page of your former edition, and that very place where the insertion was to be was in the compositors' hands. The correction in the first sheet which you would have, *plusquam duplo, et plusquam decuplo*, was provided for before ; for we printed it *quasi duplo* and *quasi decuplo*, which, you know, amounts to the same thing, for *quasi* denotes either the excess or the defect, and, in my opinion, since in that place you add no reason why it will be *plusquam*, 'tis neater to put it *quasi*, undetermined, and leave the reader to find it out. In the old edition, p. 34, lines 20 and 21, for *infinite major*, you had twice mended it *minor*. This, we thought, you did in haste ; for it was right before, and so we have printed it *major*. I proposed to our master printer to have Lightbody come down and compose, which at first he agreed to ; but the next day he had a character of his being a mere sot, and having played such pranks that nobody will take him into any print-house in London or Oxford ; and so he fears he'll debauch all his men. So we must let him alone, and I daresay we shall adjust the cuts very well without him. You need not be so shy of giving Mr. Cotes too much trouble. He has more esteem for you, and obligations to you, than to think the trouble too grievous ; but,

however, he does it at my orders, to whom he owes more than that, and so pray you be easy as to that. We will take care that no little slip in a calculation shall pass this fine edition. Dr. Clarke tells me you are thinking for Chelsea, where I wish you all satisfaction. I hope my picture at Thornhill's will have your last sitting, before you leave the town.¹ The time you set under your hand is already lapsed. When the two cuts are sent us we shall print faster than you are aware of—therefore, pray take care to be ready for us.—I am, Sir, your very obedient humble servant,

“ RI. BENTLEY.]

“ TO SIR ISAAC NEWTON,
at his house in Jermin Street,
near St. James's Church, London.”

Newton received this letter when he was removing from Jermyn Street to Chelsea, where he had a house “near the College.” On the 1st of July 1697, Dr. Wallis addressed letters to him at the Tower, as if he had lived at the Mint. That he had no official residence there, may be inferred from the observation of Charles Montague, in 1695, that he might have a lodging near him when he came to town to kiss the King's hand.² Towards the close of 1697, he occupied a house in Jermyn Street, near St. James's Church, where he remained thirteen years, till he went to Chelsea in October 1709. About the end of September 1710, he removed to Martin Street, near Leicester Fields, where he resided during the rest of his life. This house, which we have represented in the adjoining sketch, from a photographic picture, is the first house on the left hand, or east side of Martin Street, as you enter it from Leicester Square. It stands at the corner of Long's Court, beside a chapel, and is surmounted by a wooden erection, said to have been Newton's private observatory. The house, which

¹ This picture was bequeathed by Bentley to Trinity College.

² I find it stated in Conduitt's MSS., that Halley once dined with Newton at the Mint.

is now occupied as a printing-office, is described by Mr. Heneage as one "of good size, and formerly perhaps of some pretensions."¹

Nearly four years elapsed before the second edition of the *Principia* was completed ;² and, about the beginning of July 1713, this happy event was intimated to Sir Isaac in the following letter from Bentley, without date, but bearing the post-mark of July 1st :—

“DEAR SIR,—At last your book is happily brought forth,

¹ *Literary and Historical Memorials of London*, 2 vols. Lond. 1847. Mr. Croker, in his edition of Boswell's *Life of Johnson*, mentions a plan of converting Newton's house into a lecture-room.

² See vol. i. pp. 274-279.

and I thank you anew that you did me the honour to be its conveyer to the world. You will receive by the carrier, according to your order, six copies ; but pray be so free as to command what more you shall want. We have no binders here that either work well or quick, so you must accept of them in quires. I gave Roger (Cotes) a dozen, who presents one to Dr. Clarke and Whiston. This I tell you, that you may not give double ; and on that account I tell you that I have sent one to the Treasurer, Lord Trevor, and Bishop of Ely. We thought it was properest for you to present Dr. Halley—so you will not forget him. I have sent (though at great abatement) 200 already to France and Holland. The edition in England to the last buyer is 15s. in quires, and we shall take care to keep it up so for the honour of the book. I can think of nothing more at present, but shall expect your commands, if you have anything to order me.—I am, with all respect and esteem, your affectionate and humble servant,

“RI. BENTLEY.

“ *Tuesday*, TRIN. COLL.

“ TO SIR ISAAC NEWTON,

at his house in Martin Street,

near Leicester Fields, London.”

During the years 1712 and 1713, when Newton was occupied with this work, he was obliged to devote much of his leisure to the fluxionary controversy which had now begun to divide the mathematical world. The publication of the differential method of Leibnitz in 1684, before Newton had made public his method of fluxions, rendered it necessary that he should establish, by authentic documents, his prior claim to that great discovery. The Royal Society had, indeed, in 1712, appointed a committee of their body to examine the letters and papers which related to the question, but all the labour of research fell upon Newton, and the *Commercium Epistolicum*, which contained the documents and the report of the committee, though not written by him, in the ordinary

sense of the term, was yet virtually his production. A controversy then arose between the English and continental mathematicians, which harassed him during the rest of his life ; and though he seldom appeared in the front of the battle, yet he supplied the munitions of war, and guided the army of his disciples with all the prudence and skill of a leader.

Owing to the interest excited by this controversy, of which we have given an ample history in a former chapter, the Royal Society and its distinguished members became better known on the Continent, and foreigners of distinction sought for admission among its Fellows.¹ Among these was the Duke D'Aumont, who came to England as Ambassador Extraordinary from France in January 1713.² He was elected a Fellow of the Royal Society on the 21st of May, and he afterwards addressed a letter to the Society³ of such a kind, that Newton "returns him their thanks for the great humanity and civility with which he has treated them ;" tells him "that his letter was read in a full meeting of the Society to the great satisfaction and pleasure of all the members present," and assures him "that when anything comes to their knowledge which they may think acceptable to his Grace, they will take care to communicate it."⁴

The Duke D'Aumont was accompanied to England by Mr. Deslandes, the author of a work entitled *A Critical History of Philosophy*.⁵ Deslandes dined at Newton's house in company with Halley, Demoivre, and Mr. Craig, and has given the following interesting account of his visit :—"I may be permitted," he says, "to mention here an anecdote, not for the honour which may attach to me from having been familiar with the

¹ A very large number of foreign ambassadors and persons of distinction were chosen Fellows of the Society at this period.

² Swift's *Works*, January 2d and 4th, 1713, vol. xiv. pp. 333, 335. Edit. 1784.

³ This letter, dated February 25, 1714, and an English version of it, are preserved in the Royal Society, A 55, 56.

⁴ This letter, dated May 27, 1714, is published in the *Macclesfield Correspondence*, vol. ii. p. 420.

⁵ *Histoire Critique de la Philosophie*, par Mr. D. [Deslandes], 4 vols. 12mo. Amst. 1737. Vol. ii. pp. 264, 265.

greatest men of the age, but from the bearing which it may have on the history of philosophy. Having gone to England with the late Duke D'Aumont, who united with the highest talents a generosity almost unknown in our times, I was invited to dine with the illustrious Mr. Newton. And as it is the custom in England, after dinner, to drink to the health of kings and princes whom philosophers generally do not know, and seldom associate with, Mr. Newton more judiciously proposed to me to drink the health of all honest persons, to whatever country they belonged. 'We are all friends,' he added to me, 'because we unanimously aim at the only object worthy of man, which is the knowledge of truth. We are also all of the same religion, because, leading a simple life, we conform ourselves to what is right, and we endeavour sincerely to give to the Supreme Being that worship which, according to our feeble lights, we are persuaded will please him most.' The witnesses to this speech were Mr. Halley, Mr. De Moivre, and Mr. C— (Craig), all mathematicians of the first order."

In the following year, Prince Alexander Menzikoff addressed a letter to Newton, expressing his admiration of the wisdom, bravery, and rare talents of the English nation, and soliciting admission into the illustrious Society of which he was the President.¹ He was accordingly elected on the 29th July 1714; and it appears from Newton's answer, that the English merchants had requested this honour for the Prince on account of his humanity, his love of science, and his affection for the English.²

The great problem of the determination of the longitude at sea, to which the discoveries of Newton so greatly contributed, had begun, at this time, to attract the notice of English mathematicians. At an earlier period indeed, the subject had been

¹ This letter, dated Petersburg, Aug. 23, 1714, has been preserved. The Prince's signature, as if written with a paralytic hand, is illegible.

² Three drafts have been preserved of Newton's letter, written in Latin, and dated October 25, 1714

brought before the leading members of the Royal Society under very singular circumstances. Towards the close of 1674, Le Sieur de St. Pierre, a French charlatan, who commanded the interest of the Duchess of Portsmouth, had procured from the King a commission for examining a scheme for the discovery of the longitude. This commission, among other names, included those of Lord Brouncker, Dr. Ward, Sir C. Wren, Sir Jonas Moore, and Dr. Hooke. In February 1675, Flamsteed was on a visit to Sir Jonas Moore, and having accompanied him to a meeting of the commissioners, his name was added to their list. By his assistance the ignorance and presumption of the Frenchman were soon exposed; and the result, though mortifying to his patrons at court, proved highly advantageous to the interests of astronomy. Flamsteed had written a letter to the commissioners, and another to St. Pierre, explanatory of his views, and thus describes the origin of the Royal Observatory of Greenwich:—"I heard," he says, "no more of the Frenchman after this; but was told that my letters being shown King Charles, he, startled at the assertion of the fixed stars' places being false in the catalogue (of Tycho), and said with some vehemence, 'he must have them anew observed, examined, and corrected, for the use of his seamen;' and further (when it was urged to him how necessary it was to have a good stock of observations taken for correcting the motions of the moon and planets), with the same earnestness, 'he must have it done.' And when he was asked who could or who should do it? 'The person,' says he, 'that informs you of them.' Whereupon I was appointed to it."¹ In the royal warrant for the payment of Flamsteed's salary, the astronomical observator, as he was then called, was commanded "to apply himself forthwith, with the utmost care and diligence, to rectify the tables of the motions of the heavens, and the places of the fixed stars, so as to find out the so much desired longitude of places for the perfecting the art of navigation."²

¹ Baily's *Flamsteed*, pp. 37, 38.

² *Ibid.* pp. 111, 112.

No further steps seem to have been taken in this important matter till the 25th May 1714, when several captains of her Majesty's ships, merchants of London, and commanders of merchantmen, presented a petition to the House of Commons, setting forth "that the discovery of longitude is of such consequence to Great Britain, for safety of the navy, for merchant ships, as well as of improvement of trade, that for want thereof many ships have been retarded in their voyages, and many lost; but if due encouragement were proposed by the public, for such as shall discover the same, some persons would offer themselves to prove the same before the most proper judges, in order to their entire satisfaction, for the safety of men's lives, her Majesty's navy, the increase of trade, and the shipping of these islands, and *the lasting honour of the British nation.*"

This sagacious petition, which proved to be a grand step in the advancement of astronomy,¹ was submitted to a large committee, whose report was laid on the table of the House on the 7th of June, and taken into consideration on the 11th. The following is the report and resolution of the committee, which, as we shall see, forms an important event in the life of Newton:—

"Mr. Ditton and Mr. Whiston being examined, did inform the committee that they had made a discovery of the longitude, and were very certain that the same was true in the theory, and did not doubt but that, upon due trial made, it would prove certain and practicable at sea.

"That they had communicated the whole history of their proceedings towards the said discovery to Sir Isaac Newton, Dr. Clarke, Mr. Halley, and Mr. Cotes, who all seemed to allow of the truth of the proposition as to the theory, but doubted of several difficulties that would arise in the practice."

Sir Isaac Newton, attending the committee, said,—

"That for determining the longitude at sea there have been several projects, true in theory, but difficult to execute.

¹ See vol. i. p. 306.

“ 1. One is by a watch to keep time exactly ; but, by reason of the motion of the ship, the variation of heat and cold, wet and dry, and the difference of gravity in different latitudes, such a watch hath not yet been made.

“ 2. Another is by the eclipses of Jupiter’s satellites ; but, by reason of the length of telescopes requisite to observe them, and the motion of a ship at sea, those eclipses cannot yet be there observed.

“ 3. A third is by the place of the moon ; but her theory is not yet exact enough for that purpose. It is exact enough to determine the longitude within two or three degrees, but not within a degree.

“ 4. A fourth is Mr. Ditton’s project : And this is rather for keeping an account of the longitude at sea, than for finding it, if at any time it should be lost, as it may easily be in cloudy weather. How far this is practicable, and with what charge, they that are skilled in sea affairs are best able to judge. In sailing by this method, whenever they are to pass over very deep seas, they must sail due east or west, without varying their latitude ; and if their way over such a sea doth not lie due east or west, they must first sail into the latitude of the next place to which they are going beyond it, and then keep due east or west, till they come at that place.

“ In the three first ways there must be a watch regulated by a spring, and rectified every visible sunrise and sunset, to tell the hour of the day or night. In the fourth way such a watch is not necessary. In the first way there must be two watches, this and the other above-mentioned.

“ In any of the three first ways, it may be of some service to find the longitude within a degree, and of much more service to find it within forty minutes, or half a degree if it may, and the success may deserve rewards accordingly.

“ In the fourth way, it is easier to enable seamen to know their distance and bearing from the shore, forty, sixty, or eighty miles off, than to cross the seas ; and some part of the reward may be given, when the first is performed on the coast of Great

Britain, for the safety of ships coming home ; and the rest, when seamen shall be enabled to sail to an assigned remote harbour without losing their longitude if it may be.

“ Dr. Clarke said that there could no discredit arise to the Government in promising a reward in general, without respect to any particular project, to such person or persons who should discover the longitude at sea.

“ Mr. Halley said, that Mr. Ditton’s method for finding the longitude did seem to him to consist of many particulars which first ought to be experimented before he could give his opinion ; and that it would cost a considerable sum to make the experiments, but what the expense would amount to he could not tell.

“ Mr. Whiston affirmed that the undoubted benefit which would arise in the land, and near the shore, would vastly surmount the charges of experiments.

“ Mr. Cotes said that the project was right in the theory near the shore, and the practical part ought to be experimented.

“ And, upon the whole, the committee came to these resolutions : ‘ That it is the opinion of this committee that a reward be settled by Parliament upon such person or persons as shall discover a more certain and practicable method of ascertaining the longitude, than any yet in practice ; and the said reward be proportioned to the degree of exactness to which the said method shall reach.’ ”

This resolution was unanimously adopted by the House.

The bill passed through the House of Commons on the 3d of July,¹ and the House of Lords on the 8th of that month.²

This important bill, which, as predicted by British captains and merchants, has in various ways contributed “ to the lasting honour of the British nation,” contributes in no slight degree to the honour of Newton. Had the evidence of the different witnesses in Parliament been recorded without their names, it

¹ Journals of the House of Commons, vol. xvii. pp. 641, 671, 677, and 716.

² In consequence of this Act, Henry Gully, an Englishman, devoted himself to the improvement of timekeepers. He settled in Paris, made various improvements upon watches, and had for his pupil the celebrated Julien le Roy, to whom, and to his son, M. Berthoud, the art of watchmaking is under great obligations.

would not have required the sagacity of Bernouilli to have discovered the testimony of Newton,—the “lion from his claw.” The most distinguished of his successors, with all the lights of a century and a half, could not have stated more correctly the true and the only methods of finding the longitude at sea. The method by chronometers has been brought to the highest perfection, and is doubtless the most correct and infallible. The method “by the place of the moon,” has, by means of his own lunar theory, perfected by his successors, become second only to that of “the watch.”

So early as 1696, a report was spread among the members of the Royal Society that Newton was occupied with the problem of finding the longitude at sea; but the report having no foundation, he requested Halley to acquaint the members “that he was not about it.”¹ Long after this, however, his attention was directed to the invention of an instrument for finding the longitude by the place of the moon; and, in the year 1700, he communicated to Dr. Halley the description of a reflecting sextant, for observing the moon’s distance from the fixed stars at sea.²

The bill which had been enacted for rewarding the discovery of the longitude, seems to have stimulated the inventive powers of Sir Christopher Wren, then in his eighty-third year. He communicated the results of his study to the Royal Society, as indicated by the following curious document, which I found among the manuscripts of Newton:—

“Sir Christopher Wren’s Cypher, describing three Instruments proper for discovering the Longitude at Sea, delivered to the Society Novemb. 30, 1714, by Mr. Wren :

OZVCVAYINIXDNCVOCWEDCNMALNABECIRTE
WNGRAMHHCCAW.

WWERRCSHEPCIP.—Vera Copia,

“EDM. HALLEY.”

¹ *Macclesfield Correspondence*, vol. ii. p. 419.

² See vol. i. p. 209.

We presume that each of these paragraphs of letters is the description of a separate instrument. If it be true that every cypher can be decyphered, these mysterious paragraphs, which their author did not live to expound, may disclose something interesting to science.

Since the first edition of this work was published, the above cypher has been decyphered by Mr. Francis Williams of Grange Court, Chigwell. Each paragraph, according to Mr. Williams, is written backwards. If then the order of the letters be reversed, and every third letter omitted, the sentences will stand thus—

WACH MAGNETIC BALANCE WOUND IN VACUO.
 FIX HEAD HIPPESE HANDES POISE TUBE ON EYE.
 PIPE SCREW MOVING WHEELS FROM BEAKE.

The *omitted* letters, in each of the three sentences, make—

CHR WREN MDCCXIII or MDCCXIV.

In the first sentence there is a misprint,—a Y for a V.

The three last omitted Z's occur in the first part of each cypher, to show that that part must be taken last.

The three inventions contained in the cypher seem to refer to the 1st, 2d, and 4th methods of finding the longitude, mentioned in page 199.

1. A watch going in vacuo.

2. A method of poisoning a telescope on shipboard to observe the eclipses of Jupiter's satellites; and

3. Some machinery at the beak of the ship for "keeping an account of the longitude at sea," as proposed by Mr. Ditton.

After the death of Newton, the problem of finding the longitude at sea became a subject of general interest throughout Europe. Various acts relating to it were passed in England. In 1726, our countryman, John Harrison, produced a timepiece of singular accuracy, and, after many trials, in one of which it gave the longitude within 10' 45" of the truth, £10,000, half the reward offered in Queen Anne's Act, was adjudged to him;

and the other half promised when an equally good timepiece, upon the same principle, should be made by himself or others. Mr. Kendal, who was appointed by the Board to make such a watch, succeeded so completely, that after it had been round the world with Captain Cook in the years 1772-1775, the second £10,000 was given to Mr. Harrison. In order still farther to encourage inventions for the discovery of the longitude, a new Act was passed in 1774, offering a reward of £5000 for a chronometer or timepiece that would determine the longitude within a degree, or sixty geographical miles ;—of £7000 for determining it within two-thirds of a degree, or forty miles ; and £10,000 for determining it within half a degree, or thirty miles. The very same rewards were offered for any other method by which the same accuracy was obtained ; and a special reward of £5000 was promised to the author of such solar and lunar tables as were sufficiently exact to show the distance of the moon from the sun and stars, within *fifteen* seconds of a degree, “ *such tables being constructed entirely upon the principles of gravitation laid down by Sir Isaac Newton, except with respect to those elements which must necessarily be taken from astronomical observations.*” In terms of this Act, the widow of Tobias Mayer received £3000 for his lunar tables, and Euler £300 for the theorems on which they were founded.¹

The Board of Longitude in France, established to promote the same object as the English Board, rewarded Euler for the new tables which he published in 1771, and, during the rest of the eighteenth century, and the first quarter of the nineteenth, these two Boards exerted themselves in the promotion of all those scientific objects which were calculated to improve the instruments and methods for determining the longitude at sea. The French Board, composed of the most distinguished astronomers in France, exists in all its original activity and usefulness ; but, as if we had ceased to be a maritime nation, the British

¹ See vol. i. pp. 305-307.

Board was abolished in 1828,—the only scientific Board in the kingdom which afforded salaries for scientific men.

Such is the official account of the part which Newton took in promoting this important measure, and a more clear and satisfactory testimony than his was never given before a committee of the House of Commons. Mr. Whiston, however, has left behind him an account of what took place in the committee, which has been interpreted by M. Biot in a way very offensive to the friends of Newton. “As soon as the committee was set,” says Whiston,¹ “which was a very large one, Newton, Halley, Clarke, and Cotes appeared, a chair was placed for Sir Isaac near the chairman,² and I stood at the back of it. What the rest had to say they delivered by word of mouth, but Sir I. Newton delivered what he had to say in a paper. Upon the reading of this paper, the committee were at a loss, as not well understanding its contents, Sir I. Newton sitting still and saying nothing by way of explication. This gave the chairman an opportunity which it was perceived he wanted, of trying to stop the bill; which he did by declaring his own opinion to be, that ‘unless Sir I. Newton would say that the method now proposed was likely to be useful for the discovery of the longitude, he was against making a bill in general for a reward for such a discovery,’ as Dr. Clarke had particularly proposed to the committee. Upon this opinion of his, not contradicted by any other member of the committee, and upon Sir Isaac Newton’s silence all the while, I saw the whole design was in the utmost danger of miscarrying. I thought it therefore absolutely necessary to speak myself, which I did nearly in these words:— ‘Mr. Chairman, the occasion of the puzzle you are now in, is nothing but Sir I. Newton’s caution. He knows the usefulness of the present method near the shores (which are the places of greatest danger).’ Whereupon Sir Isaac stood up and said,

¹ Historical Preface to some of the copies of his “Longitude Discovered, Lond. 1738,” p. v., dated, as Mr. Edleston conjectures, in 1742.—*Correspondence, &c.*, p. lxxvi.

² Mr. Clayton, M.P. for Liverpool.

that 'he thought this bill ought to pass, because of the present method's usefulness near the shores.' Which declaration of his was much the same with what he had said in his own paper, but which was not understood by the committee, and determined them unanimously to agree to such a bill." The effect of Newton's opinion upon the committee must have been highly gratifying to himself and his friends; and when he simply paused in repeating orally what he had so distinctly read from his paper, he little thought that a future biographer would ascribe an interval of silence to "puerility of conduct," to "an inexplicable timidity of mind, and to the consequences of a previous mental aberration."¹

During the dissensions which prevailed in the ministry before the death of Queen Anne, the Tories were desirous of securing for their friends some of the more valuable offices in the patronage of Government. The Mastership of the Mint was one of those which they thought within their reach, and the scheme of releasing Sir Isaac from the labours of his office, and

¹ "Les trois derniers (Halley, Cotes, and Clarke) exprimèrent leur avis verbalement; mais Newton lut le sien, sur un papier écrit qu'il avait apporté, et qui ne fut compris de personne; puis il se rassit, et garda obstinément le silence, quelque instance qu'on lui fit de s'expliquer plus ouvertement. Enfin Whiston voyant que le bill allait être retiré, prit sur lui de dire que si M. Newton ne voulait pas s'expliquer davantage, c'était par crainte de se compromettre; mais qu'au fond, il trouvait le projet utile: Alors M. Newton répéta presque mot à mot ce qu'avait dit Whiston, et le projet du bill fut accepté. Cette conduite presque puérile, dans une circonstance si solennelle pourrait prêter aux plus étranges conséquences, surtout si on la rapporte au fatal accident que Newton aurait éprouvé en 1695." Biot, *Biog. Univ.* Art. Newton, pp. 192, 193.

Mr. Edleston justly remarks, that "*this is not a model of accurate condensation,*" and he leaves it to the reader, who will, of course, make the requisite allowance for the forwardness and vanity of the reporter, to judge whether M. Biot's term "presque puérile" be a proper epithet to apply to the part that Newton took on the occasion."—*Correspondence, &c.*, p. lxxvi., note 167.

A more correct view of Newton's conduct was taken by my distinguished friend the late Professor Rigaud. "What kind of persons," he says, "the committee must have consisted of, that such a plain statement as Newton's should not have been understood by any one of them, I cannot tell. The whole story is evidently tinctured by Whiston's spleen and disappointment."—MS. letter, Oct. 21, 1830. M. Biot is mistaken in saying that the act of 1714 *is still in force*. It was repealed, along with various Longitude Acts, in 1774.

thus giving him more leisure for the prosecution of his studies, seemed to be one that was likely to meet with general approbation. It was resolved, therefore, to offer him a pension of £2000 on the condition that he resigned the Mastership of the Mint, the salary of which was only about half of that sum ; and Dr. Swift was commissioned by Bolingbroke, one of the Secretaries of State, to propose the plan to Mrs. Catherine Barton,¹ the particular friend of Swift, and the favourite niece of Newton. The liberality of the offer might have tempted ordinary functionaries, but it met with a very different reception from Newton, who saw at once the character and object of the proposal. When Mrs. Barton communicated to him the message from Bolingbroke, Sir Isaac replied, "My place is at their service, but I will have no pension."²

Although the character and talents of Newton had been appreciated at Court during the life of Prince George of Denmark, yet, in the latter years of Queen Anne, the political party to which he belonged had ceased to be in the ascendant. His patron, Lord Halifax, the supporter of every liberal measure in the Upper House, had thus excited the hostility of the Tories, and had rendered himself doubly obnoxious by his attachment to the House of Hanover. When the Act for the naturalization of the Hanoverian family, and the better securing the crown in the Protestant line, had passed, Lord Halifax was selected to carry the act and the insignia of the Order of the Garter to the Electoral Prince ; and in 1714 he succeeded in procuring a writ to call the Elector of Hanover as Duke of Cambridge to the House of Peers. These proofs of his devotion endeared him to the House of Hanover ; and on the death of the Queen on the 1st of August 1714, and the accession of George the First, he was nominated one of the Lords of the Regency in his Majesty's absence. He discharged this trust with such zeal and fidelity, that he was admitted into the most

¹ The name *Mrs.* was then given to unmarried women

² Conduitt's MSS.

secret counsels of the King, appointed First Lord of the Treasury, created Earl of Halifax, and admitted a Knight Companion of the Order of the Garter. From the elevated position to which his friend had now attained, and the ascendancy of those opinions which he had never ceased to advocate, Newton naturally became an object of interest at court. His high situation under Government, his European reputation, his spotless character, and, above all, his unaffected piety, attracted the attention of the Princess of Wales, afterwards Queen Consort of George the Second. This lady, who possessed a highly cultivated mind, derived the greatest pleasure from conversing with Newton and corresponding with Leibnitz. In all her difficulties she received from Sir Isaac that information and assistance which she had from other quarters sought in vain; and she had been often heard to declare, that she was fortunate in living at a time when she could enjoy the conversation of so great a genius.

Though a man of robust health and a sound constitution, the Earl of Halifax did not long survive the honours which had been conferred upon him, and Newton had to mourn the loss of his earliest and best friend. When on a visit at the house of Mynheer Duvendoord, one of the Dutch ambassadors, he was seized with inflammation in the lungs, of which he died on the 19th May 1715, in the 47th year of his age.¹

This accomplished nobleman, to whom Sir Isaac owed his appointment in the Mint, was distinguished as the patron of literature as well as of science. He was the intimate friend of Addison, Congreve, Prior, Tickell, Steele, and Pope, and as the author of the *Battle of the Boyne*, the *Man of Honour*, and the greater part of the "*Country Mouse and the City Mouse*,"

¹ In writing to Sir John Newton of Westly, on the 23d May 1715, four days after the death of Lord Halifax, Sir Isaac Newton says, "I am concerned that I must send an excuse for not waiting upon you before your going into Lincolnshire. The concern I am in for the loss of my Lord Halifax, and the circumstances in which I stand related to his family, will not suffer me to go abroad till his funeral is over."

he was ranked even by Addison among the poets of the day.¹

I'm tired with rhyming, and would fain give o'er,
But justice still demands one labour more—
The noble Montague remains unnamed,
For wit, for humour, and for judgment famed.

Like Locke and Bentley, he was very desirous of understanding the *Principia*, and he one day asked Sir Isaac if there was no way of making himself master of his discoveries without learning mathematics. Sir Isaac replied that it was impossible, but Mr. Maine having recommended to his Lordship Mr. Machin, a friend of Newton's, and Professor of Astronomy in Gresham College, as a proper person to give him instructions in mathematics, he presented him with fifty guineas to encourage him. The task, however, proved more difficult than either party had expected, and Machin told Mr. Conduitt that, after trying various schemes, they gave it up in despair.²

As a frequent visitor at the house of Sir Isaac, Lord Halifax became acquainted with his niece, Mrs. Catherine Barton, a lady of wit, beauty, and accomplishments.³ She was the daughter of Robert Barton, Esq. of Brigstock, in Northamptonshire, and Hannah Smith, Newton's half-sister; and so great an impression had she made upon Lord Halifax, that in a codicil to his will in 1706, he bequeathed to her all the jewels he should have at the time of his death, and three thousand pounds, "as a small token of the great love⁴ and affection he had long had

¹ The *Poetical Works* of the late Right Hon. CHARLES EARL OF HALIFAX. London, 1716, 2d edit.

² Conduitt's MSS.

³ Born 1679, married August 26, 1717, died 20th January 1739.

⁴ The words *love* and *affection* had not, in Halifax's day, the same meaning which they have now. Swift, for example, writes to Stella that he "*loves* Mrs. Barton better than any one here." Speaking of the Duke of Argyle, he says, "*I love that Duke mightily.* Lady Mountjoy is a little body I *love very well.*" Speaking of the pictures of Lady Orkney, Lord Bolingbroke, and Lady Masham, he says, "I shall have the pictures of those I *really love* here." In like manner, Pope writes to H. Cromwell, "I should be glad to tell all the world that I have an *extreme affection and esteem* for you."

for her." Mrs. Catherine Barton was only in her twenty-seventh year, and, under ordinary circumstances, a marriage might have been expected as the result of so ardent an attachment. On the death, however, of his first wife, the Countess of Manchester, Halifax is said to have resolved to lead a single life, though it has been asserted, on the authority of his rival,¹ that he was disappointed in gaining the affections of a lady of great birth and fortune, to whose hand he had aspired. But however this may be, his attachment to Miss Barton continued unabated, and, at his death in 1715, it was found that, by another codicil, dated February 1, 1712, he had greatly increased the bequest which he had made in 1706. He left to Sir Isaac Newton the sum of one hundred pounds, as "a mark of the great honour and esteem he had for so great a man;" and he "bequeathed to his niece, Mrs. Catherine Barton, the sum of five thousand pounds," with "a grant from the Crown, during her life, of the Rangership and Lodge of Bushy Park, with all the household goods and furniture;" and, to enable her to keep the house and garden in good order, he bequeathed his manor of Apscourt, in Surrey. "These gifts and legacies," he adds, "I leave to her as a token of the sincere love, affection, and esteem I have long had for her person, and as a small recompense for the pleasure and happiness I have had in her conversation." He charges also his executor to "transfer to her an annuity of two hundred pounds per annum, purchased in Sir Isaac Newton's name, and which he (Lord Halifax) held in trust for her."

When the contents of this will became known after the death of Halifax, Miss Barton did not escape the censure of the world, though she was regarded by all who knew her as a woman of strict honour and virtue. During his lordship's life, and when a frequent visitor at the house of Newton, his affection for Miss Barton, and his delight in her society, never

¹ The Earl of Shaftesbury. See his *Letters to Robert Malesworth, Esq.* Edit. 1750, lett. iii. pp. 70-72.

once excited the criticism of his contemporaries ; and there is not the slightest reason to believe that it exceeded that love and admiration which married men, and men of all ages, ever feel in the presence of physical and intellectual beauty. Halifax was not a libertine, and the very terms of affection in which he accounts for his liberality to Miss Barton are the most satisfactory proof that his love was virtuous and her conduct pure. If there is one hour in man's life more solemn than another, it is that hour when he is preparing for his death.

Venit summa Dies, et ineluctabile fatum,

were the words which Halifax prefixed to the codicil, which evinces his affection and liberality to Miss Barton ; and he little thought that the language of the heart, dictated at such an hour, would be regarded as a record of her shame. Nor is it a slight testimony to the purity of his affection for Miss Barton, that he introduces his liberality to her by a legacy to her pious uncle, Sir Isaac Newton, his earliest and best friend, "as a mark of the great honour and esteem he had for so great a man ;" and that he records the fact of his holding for her in trust an annuity of two hundred pounds per annum, purchased in Sir Isaac Newton's name.

Although it is stated that Miss Barton did not escape from censure, yet calumny, with her many tongues, does not seem to have left upon record the slightest charge against her character. Flamsteed, who never scrupled to calumniate Newton in language applicable only to the most abandoned of mankind, would have gloated over a charge so destructive of the character of his *friend*. He mentions, however, merely the fact of Lord Halifax's bequest, and he has limited his malice, if he meant it to be malicious, to the simple act of placing the words *excellent conversation* in italics.¹

¹ Baily's *Flamsteed*, Letter to Sharp, July 9, 1715. He adds, "Sir I. Newton loses his support in him (Halifax), and having been in with Lord Oxford, Bolingbroke, and

The only contemporary document which really bears upon this question, is the following passage in an anonymous *Life of the Earl of Halifax*, published in 1715.¹

"I am likewise to account," says the author, "for another omission in the course of this history, which is that of the death of Lord Halifax's lady ;² upon whose decease his Lordship took a resolution of living single thenceforward, and cast his eye upon the widow of one Colonel Barton, and niece to the famous Sir Isaac Newton, to be superintendent of his domestic affairs. But as this lady was young, beautiful, and gay, so those that were given to censure, passed a judgment upon her which she no ways merited, since she was a woman of strict honour and virtue ; and though she might be agreeable to his Lordship in every particular, that noble peer's complaisance to her proceeded wholly from the great esteem he had for her wit and most exquisite understanding,³ as will appear from what relates to her in his will at the close of these *Memoirs*."⁴

With the exception of the mistake that the lady was the widow of Colonel Barton, we may admit the truth of the preceding passage. We shall therefore adopt it as the foundation of our argument, and we may admit that it was known to

Dr. Arbuthnot, is not now looked upon as he was formerly," p. 314. See also pp. 73 and 317, where the great intimacy of Newton and Halifax is mentioned.

¹ This *Life of Halifax*, written by some literary hack of the disreputable house of Curll and Co., cannot be regarded as a work of any authority upon the statements of which we can safely rely. The anonymous author obviously received no information from the family of Halifax, and therefore any fact which he did not derive from public documents, must be considered as resting upon vulgar rumour. The author himself says, in his Dedication to George Earl of Halifax, that "he is sensible that he has been guilty of many omissions through want of intelligence from persons who might have obliged him with proper information." In a copy of the first edition of the *Life of Halifax*, in the University Library of Cambridge, the author is said to be William Pittis.

Newton and his friends. After the death of Halifax, Miss Barton continued to reside, as she always did, in so far as there is any evidence on the subject, with her uncle Sir Isaac. He gave splendid entertainments at his house in Martin Street, where the most distinguished foreigners were occasionally assembled, and where doubtless the best company in London was to be found. Miss Barton presided at her uncle's table, and by her "excellent conversation," excited the love and affection even of some of her married friends. M. Montmort, a married man and a distinguished mathematician, had heard of her wit and beauty before he had visited England, and after he had met with her as a friend of Sir Isaac's, his admiration knew no bounds. In a letter addressed to Montmort by the celebrated Brook Taylor, another of Newton's friends, Miss Barton had sent her compliments to him, and he is thus led to express in the warmest terms, compared with which those of Halifax are cold, the great admiration with which Miss Barton had inspired him.¹

Among the other admirers of Miss Barton, we must mention Dean Swift, who frequently visited her, and on one occasion "at her lodgings," that is, we presume, in the house of Sir Isaac Newton, with whom, as Mr. Conduitt distinctly tells us, "no other person ever lived." Thus loved and admired by politicians, wits, and philosophers, she remained in Newton's house till the 24th of August 1717, when she married John Conduitt, Esq.,² M.P., of Cranbury in Hampshire, a gentleman of independent circumstances, and much esteemed by Sir Isaac. The result of this marriage was an only daughter, Catherine Conduitt, who was born in 1718, and who was married in 1740 to the Honourable John Wallop, afterwards Lord Viscount Lymington. She died in 1750, at the early age of thirty-two, leaving one daughter and four sons, from the eldest of whom the Portsmouth family are descended.

During the century and a half which has passed away since

¹ See APPENDIX, No. XVII.

² Born 1688 ; died May 20, 1737, *æt.* 49.

the death of Halifax, no stain has been cast on the memory of Mrs. Conduitt, and the very writer whose ambiguous words have been misinterpreted to her injury, has himself declared that *she was a woman of strict honour and virtue*, and that *the complaisance to her of the noble peer proceeded wholly from the great esteem he had for her wit and most exquisite understanding*.¹ On such authority the biographers of Newton, while they recounted with pride the beauty and accomplishments of his niece, could not but feel another interest in one who had been the ornament of his domestic circle, and the solace of his declining years. They did not attempt to conceal the warmth of Halifax's attachment to her, or omit to record the liberality with which it was marked ; but they never imagined that the affection breathed in the solemn pages of a will would be viewed as the expression of unhallowed love, and that a bequest to a female friend would be regarded as the wages of iniquity.

As every event in Newton's life, and every topic with which his name is associated, possess the deepest interest, it is desirable that those which affect the character of so great a man should be examined and discussed when it is possible to find materials by which we may explain what is ambiguous, or refute what is false. Viewed in this light, we are disposed to welcome the discussion which has lately been raised by Mr. De Morgan in reference to the nature of the attachment which subsisted between Miss Barton and the Earl of Halifax.²

¹ The sneer of Voltaire in ascribing Newton's promotion to the Mint to the beauty of his niece, scarcely deserves our notice. Miss Barton was only sixteen when he received the appointment, and Montague could not then have seen her. Voltaire, however, makes no insinuation against the character of Miss Barton. "J'avais cru, dans ma jeunesse," says he, "que Newton avait fait sa fortune par son extrême mérite. Je m'étais imaginé que la cour, et la ville de Londres l'avait nommé par acclamation grand maître des monnaies du royaume. Point du tout. Isaac Newton avait une nièce assez aimable nommé Madame Conduitt, elle plut beaucoup au grand Trésorier Halifax. Le calcul infinitésimal et le gravitation ne lui auraient servi de rien sans une jolie nièce."—*Dict. Philos.* tom. iv. p. 61.

² This discussion will be found under the title of *Lord Halifax and Mrs. Catherine Barton*, in *Notes and Queries*, No. 210, November 5, 1853, pp. 429, 433, in an elaborate article marked by the usual acuteness of that distinguished writer.

Assuming it as proved, by the single testimony of the biographer of Halifax, that Miss Barton "*was received by Montague into his house as superintendent of his domestic affairs,*" and that she left the house of her uncle Sir Isaac Newton to cohabit with that nobleman, and believing it *to be impossible that Newton could be ignorant that his niece was regarded by the world as the mistress of his friend and political patron*, Mr. De Morgan "takes it to be established that she was *either the wife or the mistress of Halifax;*" and on various grounds, which it is unnecessary to repeat, he prefers the alternative of a private marriage. In coming to this conclusion, the most favourable certainly to Newton's reputation, Mr. De Morgan finds it difficult to explain why the marriage was concealed in the lifetime of Halifax. He ascribes it to the inferior station of Miss Barton as the *grand-daughter* of a country clergyman, which would have given the marriage the character of a *mésalliance*, from which Halifax would have been weak enough to shrink. In opposition to this estimate of Mrs. Barton's social position, we have to state that the "Bartons of Brigstock possessed estates in Northamptonshire for several hundred years, and were *nearly related* to the Earl of Rockingham, Lord Griffin, Sir Jeffrey Palmer, and other honourable families in that neighbourhood."¹ But Mr. De Morgan finds it a still greater difficulty, and entirely fails in surmounting it, to explain how there was no record of the marriage, and what could induce Sir Isaac, Mrs. Conduitt, and her husband, to conceal it, after Halifax's death, and thus to leave it as the most probable conclusion, that the niece of the one and the wife of the other had been the mistress, instead of the wife of Halifax. If there was no marriage, some kind friend might have propagated a rumour that there was; but no such rumour was ever heard, and no

¹ Conduitt's MSS. I find it stated in the handwriting of Mrs. Catherine Barton, upon the back of a drawing of the arms of the Swinfords of Stamford, that "the Bartons were descended from the Swinfords," from Catherine Swinford, the wife of Sir Hugh Swinford, who became the mistress of John of Gaunt.

attempt has ever been made to obtain such a solution of this mysterious connexion. To infer a marriage, when the parties themselves have never acknowledged it—when no trace of a record can be found—and when no friend or relation has ever attempted even to make it the subject of conjecture, is to violate every principle of sound reasoning; and we are disposed to think that Mr. De Morgan's respect for the memory of Newton has led him to what he regards as the only conclusion which is compatible with the character of a man so great and pure.

In denying the marriage, we do not admit one of the grounds upon which it has been maintained. We deny that Miss Barton ever lived a single night under the roof of Lord Halifax. His biographer makes no such statement. The passage which has given rise to the discussion contains three distinct propositions,—

1. That Halifax had resolved never to marry.
2. That he cast his eye upon Miss Barton to be the superintendent of his domestic affairs; and,
3. That she was a woman of strict honour and virtue.

The first of these propositions overturns the theory of a marriage; and the second merely proves a *plan or a wish* on the part of Halifax that Miss Barton should superintend his household,—a wish, too, which was never expressed amid the gossip of contemporary correspondence, or in the hearing of any witness. It rests, indeed, upon no other evidence than that of the anonymous biographer. Where, then, is the proof, or even its shadow, that Miss Barton occupied such a situation, or was ever once seen seated at Halifax's table? In 1710, Swift visited Miss Barton frequently, and once "at her lodgings." He dined with Halifax on the 28th November, and with Miss Barton on the 30th; and though he mentions this fact to Stella, he never alludes to any connexion whatever between his two friends.¹ But independent of these facts, there is no evidence

¹ Swift's great admiration of Miss Barton, notwithstanding her Whig politics, is no slight proof of the purity of her social position. I have placed in APPENDIX, No. XVIII.,

whatever that Miss Barton ever slept out of her uncle's house ; and we are distinctly told by Mr. Conduitt, that "nobody ever lived with Sir Isaac but his wife, who was with him near twenty years, before and after her marriage." It is not known at what time Miss Barton took up her residence with her uncle, or during what periods she may have been absent before and after her marriage, either on visits to her friends in the one case, or when living with her husband in the other ;¹ but whatever may be its amount, its addition to the twenty years of her residence with Newton, before and after her marriage, will not allow us to assign any period during which, under Halifax's roof, that love and affection which, previous to 1706, he *had long had for her*, could have been developed.

Mr. De Morgan lays great stress upon the admitted fact, that the statement in the "Life of Halifax" was "left uncontradicted by herself (Mrs. Conduitt),—by her husband,—by her daughter,—by Lord Lymington, her son-in-law,—and by the uncle (Sir Isaac Newton) who had stood to her in the place of a father. It is impossible," he adds, "that Newton could have been ignorant that his niece *was living in Montague's House*,—enjoyed an annuity² bought in his own name,—and was re-

a letter from Mrs. Conduitt to himself, and all the passages in which she and Halifax are mentioned in his journal to Stella.

¹ I find letters addressed to Mr. Conduitt at Cranbury, his country house in Hampshire, where it is probable he and his family frequently resided, when he was not attending his duty in the House of Commons. During Newton's illness in 1726, Dr. Mead addressed several letters to him "at his house near Winchester." Miss Barton, as we have already seen (p. 158), was boarded in Oxfordshire, where she had an attack of the small-pox, in August 1700. There is no evidence that she lived with Newton before this date, and we have not been able to determine at what time she took up her residence under his roof. If we suppose it to have been in 1701, we obtain sixteen years as the period of her residence in Newton's house before her marriage, and four years for her residence with him after her marriage in 1717—the other six years having been spent with her husband.

² Mr. De Morgan says, that Halifax bought this annuity for Miss Barton in Newton's name ; but this is a conjecture, and not a fact ; and we consider it quite certain, from a fair interpretation of the words, that Newton purchased this annuity, and, being nearly twenty years older than Halifax, made him the trustee. He is simply the trustee, and not the granter of the annuity. Had he granted the annuity, he would have mentioned

garded by the world as the mistress of his friend and political patron." Now, the very fact that such respectable parties, so deeply interested in the character of their accomplished relative, contradicted neither the fact, if it was a fact, nor the rumour, if it was a rumour, is a proof that there was neither fact nor rumour to contradict. How could any person contradict the *cast of an eye*,—the only act ascribed to Halifax by his biographer? How could they contradict the statement, made only in 1853, that Miss Barton lived in Montague's House, when no person in their own lifetime ever made such a

it as one of the "gifts and legacies" which he left her. An annuity purchased in Sir Isaac Newton's name can mean nothing else than an annuity purchased by Sir Isaac Newton. I find among Newton's papers a scroll of the beginning of the act of transference from the executor, George Lord Halifax, in which the date of the trust is stated to be October 26, 1706. Mr. De Morgan remarks, that if "the annuity had been bought by Newton, Conduitt would have mentioned it in his list of the benefactions which Newton's relatives received from him." But the annuity was not a benefaction like those contained in Conduitt's list. It was virtually a debt due to his favourite niece whom he had educated, and who had for twenty years kept his house; and if she had not received it from Sir Isaac, his conduct would have been very unjust, as, owing to his not having made a will, she got only the eighth part of his personal estate along with his four nephews and nieces. Mr. De Morgan makes other statements which it is necessary to examine. After mentioning the important fact, that though "Swift writes to Stella of every kind of small talk, he never mentions Halifax and Miss Barton together,—never makes the slightest allusion to either in connexion with the other, though in one and the same letter he minutes his having dined with Halifax on the 28th, and with Miss Barton on the 30th (September 1710)," he adds, "*there must have been intentional suppression in this.*" Certainly, if Swift knew or believed that Miss Barton lived with Halifax; but the true inference is, that she not only did not live with him, but that it was never even reported that she did. Mr. De Morgan, however, adds, "*All the world knew that there was some liaison between the two.*" On the contrary, we maintain that not one person in the world knew this, or could know it, in 1710. There is not a single fact to prove that the codicil of 1706 was known to any individual. Mr. De Morgan goes on to say, as if in proof of "intentional suppression," for which we can see no motive, that when Swift (November 20, 1711) records his having been "teased with Whiggish discourse" by Miss Barton, "*he does not even drop a sarcasm about her politics having been learnt from Halifax.*" Why make Miss Barton the political pupil of Halifax, seeing that her own uncle, Sir Isaac Newton, with whom she had spent the greater part of her life, and from beneath whose roof she never strayed, was one of the most decided Whigs of the day? This Whig conversation took place in the house of Lady Betty Germain, from which "it appears," as Mr. De Morgan has justly observed, "that she (Miss Barton) was regarded as a respectable woman,"—a fact of which there are abundant indications.

statement? How could they express their indignation at the charge, that she was the mistress of Halifax, when calumny had never breathed that she was, and when the very biographer, whose words are in every other respect admitted as true, declares that "she was a woman of strict honour and virtue?" However different may have been the state of public morals in the reign of George I., it would require substantial evidence to prove that the Earl of Halifax, the First Minister of the Crown, and a great favourite of the royal family, was (unknown to any contemporary writer) living in open concubinage with Miss Barton,—one of the beauties and toasts of the day,¹—the friend of Swift and Lady Betty Germain, and the accomplished and favourite niece of Sir Isaac Newton,—himself the religious instructor of the Princess of Wales,—the personal friend of the dignitaries of the Church,—and a man universally esteemed for his piety and virtue.

¹ "In a poem called the Toasters, where all the distinguished beauties at that time are celebrated in distinct epigrams, these two appear in honour of Miss Barton:—

Stamp'd with her reigning charms this brittle glass
Will safely through the realms of Bacchus pass;
Full fraught with beauty, will new flames impart,
And mount her shining image in the heart.

Another—

Beauty and Wit strive each in vain,
To vanquish Bacchus and his train;
But Barton, with successful charms,
From both their quivers drew her arms,
The roving god his sway resigns,
And cheerfully submits his vines."

Art. MONTAGUE, *Biographia Britannica*, vol. v. p. 3156, note.

CHAPTER XXII.

Leibnitz attacks Newton's Philosophy—Newton's Reply—Leibnitz attacks the English Philosophy as irreligious, in Letters to the Princess of Wales—The King requests Newton to defend himself—He claims the Invention of Fluxions—Dr. Clarke defends the English Philosophy—The Dispute carried on through the Princess of Wales—Insincerity of Leibnitz—His Death—His Eloge by Fontenelle, who apologizes to Chamberlayne for a mistake adverse to Newton—Newton's Observations on the Eloge—Varignon reconciles Newton and John Bernoulli—Newton's Correspondence with Varignon, whose views are favourable to Leibnitz—Newton asks Varignon's Opinion on the *Commercium*—His Criticisms upon it—His Death—Correspondence between Newton and John Bernoulli—Montmort's views on the Fluxionary Controversy—Nicolas Bernoulli's Letter to Newton—Letters of Dr. Smith, Dr. Derham, and Fontenelle, referred to.

BEFORE Newton had taken an open part in the fluxionary controversy, and before the publication even of the *Commercium Epistolicum*, Leibnitz had begun to challenge the soundness of the Newtonian philosophy, and to excite against it the prejudices of continental philosophers. In his *Théodicée*, published in 1710,¹ he attacks the theory of gravity, and accuses Newton of introducing occult qualities and miracles into philosophy; and, in a controversy which he had in 1711 with Hartsoecker,² who maintained that all things arose from certain atoms floating in a perfect fluid without cohesion, he took occasion to renew his attack upon the English philosophy. In this dispute with the Dutch physician, the name of Newton is not mentioned by Leibnitz, but he was so obviously the person whose opinions were assailed, that he addressed a very able reply to the editor,

¹ *Essais de Théodicée sur la Bonté de Dieu, la Liberté de l'Homme, et l'Origine du Mal.*

² *Journal de Trevoux*, May 1712.

in which neither his own name nor any of his writings are referred to. "In your weekly paper,"¹ he says, "dated May 5, 1712, I meet with two letters, one written by Mr. Leibnitz to Mr. Hartsoeker, the other by Mr. Hartsoeker to Mr. Leibnitz, in answer to the former. And in the letter of Mr. Leibnitz, meeting with some things reflecting upon the English, I hope you will do them the justice to publish this vindication as you have printed the reflection." He then proceeds to show that the theory of gravity is "proved by mathematical demonstration, grounded upon experiments and the phenomena of nature; and that to understand the motions of the planets under the influence of gravity, without knowing the cause of gravity, is as good a progress in philosophy as to understand the frame of a clock, and the dependence of the wheels upon one another, without knowing the cause of the gravity of the weight which moves the machine, is in the philosophy of clockwork; or the understanding the frame of the bones and muscles, and their connexion in the body of an animal, and how the bones are moved by the contracting or dilating of the muscles, without knowing how the muscles are contracted and dilated by the power of the mind, is in the philosophy of animal motion."²

The pertinacity with which Leibnitz reiterated his attacks upon the doctrine of gravity, has no parallel in the history of science, and it is difficult to believe that the love of truth was the only motive by which he was actuated. We have already seen³ how he indulged in the same criticisms in the postscript of his letter to the Abbé Conti in November 1715, and we shall now find him in the climax of his hostility to Newton, when in the very same month he endeavoured to misrepresent and malign his philosophy, in his correspondence with the Princess of Wales. He had no doubt learned from her Royal

¹ *Memoirs of Literature*, No. XVIII. p. 137. See Cotes' letter to Newton in *Edleston's Correspondence*, &c., p. 153.

² The scroll of this letter, which occupies two folio pages, has no date. It does not appear in the *Memoirs of Literature* for which it was written.

³ Vol. ii. p. 22.

Higness the regard which she entertained for Newton, and the pleasure and instruction which she derived from his conversation; and, under such circumstances, it might have been expected that a man of high principle would have kept in subordination his feelings as a rival, without abjuring his opinions as a philosopher. He might have taught the Princess his doctrine of pre-established harmony as incompatible with Newton's opinions respecting certain irregularities in the planetary system, or he might have whispered into the royal ear that gravity was an occult quality, and a miracle; but when he represented the Newtonian philosophy and the opinions of Locke as subversive of natural, and inferentially of revealed religion, he yielded to an ignoble impulse, and did violence to the dignity of philosophy.

In a letter which Leibnitz addressed to the Princess in the month of November 1715, the following charges were made against the English:—

“ 1. *Natural religion itself* seems to decay [in England¹] very much. Many will have human *souls* to be material; others make *God himself* a corporeal being.

“ 2. *Mr. Locke* and his followers are *uncertain* at least whether the *soul* be not *material* and naturally perishable.

“ 3. *Sir Isaac Newton* says that *space* is an *organ*, which God makes use of to perceive things by;—it will follow that they do not depend altogether upon Him, nor were produced by Him.

“ 4. *Sir Isaac Newton* and his followers have also a very odd opinion concerning the Work of God. According to their doctrine, God Almighty wants to *wind up* his watch from time to time, otherwise it would cease to move. He had not, it seems, sufficient foresight to make it a perpetual motion. Nay, the machine of God's making is so imperfect according to these

¹ The words *in England* are not in the original paragraph, but they were added either by the Princess or Dr. Clarke, and, as we shall presently see, were meant to be understood by Leibnitz himself.

gentlemen, that he is obliged to clean it now and then by an extraordinary concourse, and even to *mend* it as a clockmaker mends his work ; who must consequently be so much the more unskilful a workman, as he is oftener obliged to mend his work, and to set it right. According to *my* opinion the same *force* and vigour remains always in the world, and only passes from one part of matter to another, agreeably to the laws of nature and the beautiful *pre-established* order. And I hold that when God works miracles, he does not do it in order to supply the wants of nature, but those of grace. Whoever thinks otherwise, must needs have a very mean notion of the wisdom and power of God.”

These views of Leibnitz having become the subject of conversation at court, where Newton and Locke were in high esteem, the king, who never seems to have had much affection for his countryman, expressed a wish that Sir Isaac Newton would draw up a reply in defence of his philosophy, as well as of his claim to be the original inventor of Fluxions. It was accordingly arranged that Newton should undertake the mathematical part of the controversy, while Dr. Clarke was intrusted with the defence of the English philosophy. The Princess of Wales, therefore, communicated to the Dr. the preceding extracts from Leibnitz’s letter, and Dr. Clarke’s reply was transmitted to Leibnitz through her Royal Highness. Leibnitz replied to this communication ; and after Dr. Clarke had returned his fifth answer to the fifth paper of Leibnitz, the death of the latter, on the 14th November 1716, put an end to the controversy.¹

While this dispute was going on, Leibnitz sent an account of it to John Bernoulli, in a letter dated June 7, 1716. After abusing Brook Taylor’s Method of Increments in language which

¹ All these papers, which passed through the hands of the Princess, were published at Amsterdam in 1720, under the title of *Recueil de Diverses Pièces sur la Philosophie, la Religion Naturelle, l’Histoire, les Mathématiques, &c.*, par Messrs. LEIBNIZ, CLARKE, NEWTON, &c. They were published also in French and English in 1738 in Dr. Clarke’s *Works*, vol. iv. pp. 580-710.

the editor has struck out, he tells his correspondent that he is engaged in a philosophical dispute with Newton, or rather with his defender Clarke,—that he had written to the Princess of Wales, who took an interest in such subjects,—“that philosophy or rather natural religion, was degenerating among the English,”—that the Princess had transmitted extracts of his letter to Clarke,—that her Royal Highness had sent him his answer, and that he had replied four times to the communications of his opponent. He tells him that *space* is now the *idol* of Englishmen; and “that whatever is inexplicable from the nature of things, such as the Newtonian general attraction of matter, and other things of the same kind, is either miraculous or absurd.” He expects that the contest, from which everything offensive is excluded, will be continued, and he concludes the paragraph with the following singular sentiment, the conclusion of which may be inferred from its being struck out by the editor: ¹—

“Hujusmodi enim collationes mihi *ludus jocusque* sunt,² quia in philosophia,

¹ We hope that those who possess the originals of the *Commercium Epistolicum* of Leibnitz and Bernoulli, will supply the *numerous elisions* which the editor had not the courage to insert, as they would throw much light on the temper with which the Fluxionary controversy was carried on by these eminent mathematicians. No such eliminations have been made in the letters of Newton or his friends.

² It has been supposed by many persons that the *Théodicée* of Leibnitz, which was written for the information of the Queen of Prussia, with the view of counteracting the sceptical opinions of Bayle, did not express his own sentiments, and that Leibnitz really believed the doctrines which he impugned. Professor Pfaff of Tübingen, whose opinion of the *Théodicée* Leibnitz had requested, thus replied to him:—“It seems to me that you have invented that theological system *only in jest*, while at the bottom you receive the doctrines of Bayle; but it is necessary that some one give the dangerous principles of Bayle a *serious and thorough refutation*.” To this letter Leibnitz answered, “You are right, venerable sir, in what you say respecting the *Theodicea*. You have hit the nail on the head; and I wonder that no one before has taken this view of my intentions, for it is not the business of philosophers always to treat of subjects *seriously*; they who, as you correctly observe, so tax the powers of their mind in the invention of hypotheses. You who are a theologian, will pursue the theological course in the refutation of errors.” This letter was, of course, understood in its natural meaning; but the biographer of Leibnitz, Dr. Gurbauer, maintains it to be an *ironical answer to the presumptuous Professor!* We do not venture to say, though he has himself said it, that Leibnitz’s real opinions were not expressed in his *Théodicée*, and in his letter to the Princess of Wales,

Omnia precepi atque animo mecum ante peregi." ¹

* * * * *

It is very obvious from the notes on Dr. Clarke's replies to Leibnitz, that he had received assistance on several astronomical points from Newton himself.² Sir Isaac's attention indeed had been called to the subject by the postscript to Conti's letter, and in his reply to it, on the 26th February 1716, he devotes a page to a defence of his views and a criticism upon those of his rival. Satisfied no doubt with the ample discussion which the subject was undergoing between Clarke and Leibnitz, he takes no notice of this portion of Leibnitz's rejoinder³ in his celebrated "Remarks,"⁴ which were written in May 1716. On a subsequent occasion, when M. Des Maizeaux requested from him some new observations on the subject, he declined to renew the discussion, and assigned the following reason for his silence :—

"You know," he says, "that when Mr. L'Abbé Conti had received a letter from Mr. Leibnitz with a large postscript against me, full of accusations foreign to the question, and the postscript was showed to the King, and I was pressed for an answer, to be also showed to his Majesty,⁵ and the same was afterwards sent to Mr. Leibnitz ;⁶ he sent it with his answer to Paris, declining to make good his charge, and pretending that I

but we call the attention of the reader to the *ludus et jocus*, with which our metaphysical gladiator carried on his contest with Dr. Clarke, and pointed out the decay of natural religion in England.

¹ *Comm. Epistol. Leibnitii et Bernoullii*, tom. ii. pp. 381, 382.

² I have found, among Sir Isaac's papers, many folio pages of manuscript containing the same views as those given by Dr. Clarke.

³ Letter to Conti, April 14, 1716.

⁴ Raphson's *Fluxions*, p. 111.

⁵ "By the contrivance of some of the court of Hanover, I was prevailed with to write an answer to the post-script of a letter written by Mr. Leibnitz to Mr. L'Abbé Conti, that both might be shewed to the King. I did it with reluctancy; and by the letters which Mr. Leibnitz thereupon wrote to several at court, I found that he was at the bottom of the design. It is now about forty years since I left off all correspondence by letters about mathematics and philosophy, and therefore I say nothing farther to you about these matters."—*Scroll of a letter to the Abbé Varignon in 1718*.

⁶ This was Newton's letter to Conti of the 26th February 1716.

was the aggressor, and saying that he sent those letters to Paris that he might have neutral and intelligent witnesses of what passed between us. I looked upon this as an indirect practice, and forbore writing an answer in the form of a letter to be sent to him, and only wrote some observations¹ on his letter to satisfy my friends here that it was easy to have answered him had I thought fit to let him go on with his politicks. As soon as I heard that he was dead, I caused the letters and observations to be printed, lest they should at any time come abroad imperfectly in France. You are now upon a design of reprinting them with some other letters written at the same time, whose originals have been left in your hands for that purpose by Mr. L'Abbé Conti, for making that controversy complete, and I see no necessity of adding anything more to what has been said, especially now Mr. Leibnitz is dead.”²

After the death of Leibnitz, the fluxionary controversy was almost in abeyance. The attention of mathematicians, however, was again called to the subject by the Eloge of Leibnitz, from the pen of Fontenelle, which was published in the Memoirs of the Academy of Sciences for 1716, and by another Eloge which appeared in the *Acta Eruditorum* for 1717. The friends of Newton were not pleased with the observations of Fontenelle, and Mr. Chamberlayne, who had previously interfered between the rival analysts, did not scruple to complain of them in his “Lives of the French Philosophers.” Fontenelle received this criticism with his usual urbanity, and wrote the following note to Mr. Chamberlayne :—“ You complain of me, but after so civil a manner, that I think myself obliged to return you an

¹ Published in Raphson's *Fluxions*, p. 111.

² In this scroll, of which there is a duplicate, another page is added, giving the usual history of his discovery of fluxions. In the duplicate, apparently the first written, there is added after the word *dead*, “ For I have always industriously avoided disputes. If any thing more were to be added, it should be what follows the following declaration.” The pen is drawn through this last sentence, and the declaration is not mentioned. This paper was probably drawn up for the use of M. Des Maizeaux, in writing his preface to his *Recueil*, &c., which contains a good account of the Fluxionary dispute. The Preface is dated October 27, 1719.

answer. I confess to you sincerely that till we had seen the *Commercium Epistolicum*, it was commonly believed here that Leibnitz was the first inventor of the Differential Calculus, or at least the first publisher of it, though it was as well known that Sir Isaac Newton was master of the secret at the same time; but as he did not challenge it, we could not be undeceived, and what I said concerning it was upon the credit of the common belief, which I did not find contradicted. But since it is so now, I promise you I will change my language whenever there is an opportunity, for I do assure you that it has been my study all my lifetime, to keep myself free from any partiality, whether national or personal, nothing being my concern but truth.”¹

When Newton himself perused the Eloge of Leibnitz, which was sent to him by Varignon, he did not scruple to express his dissatisfaction with it. In thanking Varignon for his “kind present of the Elogia of the Academicians,” he says, “in that of Mr. Leibnitz Mr. Fontenelle has been very candid. There are some mistakes in matter of fact, but not by design. I reckon that Mr. Fontenelle was not sufficiently informed.” He then proceeds to point out the mistakes to which he refers, criticising at the same time the Elogium of Leibnitz in the *Acta Eruditorum*, and repeating many of the leading facts which we have already given in the history of the controversy.² As no notice is taken of these criticisms in the letters of Varignon, it is probable that they were never sent to him, and this is the more likely, as I have found three copies of a more elaborate paper entitled *Historical Annotations on the Elogium of Mr. Leibnitz*, which, in so far as I have been able to ascertain, has not been published.³

¹ This extract from Fontenelle's letter, dated February 5, 1717, is in Mrs. Barton's handwriting, and seems to have been sent by Chamberlayne to Newton.

² This scroll occupies nearly two closely written folio pages, and one part of it is almost obliterated with alterations.

³ These annotations occupy about ten closely written folio pages.

But though the leaders in this controversy had ceased to take a public or active part in it, yet some of them looked back with uneasiness to the part which they had played. John Bernoulli, who had been dragged into it by the importunities of Leibnitz, and whose character had been compromised by the disclosure of secrets which ought to have been concealed, was anxious for a reconciliation with Newton; and the Abbé Varignon, to whom he had communicated his desire, succeeded in the task. We have already¹ given a brief account of the correspondence which took place on this occasion, in so far as it forms a part of the fluxionary controversy. There are, however other points of interest in these letters which throw some light on the personal character of their authors, and we have therefore given the most interesting of them in the Appendix.² The letters of Varignon relate chiefly to the French translation of Newton's *Optics*, by M. Coste, the publication of which had been delayed by the improper conduct of the bookseller who undertook it; while those of Newton, which we possess only in scrolls, are occupied with details respecting his controversy with Leibnitz, and his nominal reconciliation with Bernoulli. That Newton never forgave Bernoulli is very distinctly shown in the following paragraph of a letter to Varignon:³—

“Demoivre told me that Bernoulli wished to have my picture; but he has not yet acknowledged publicly that I possessed the method of fluxions and moments in 1672, as is confessed in the Eloge on Leibnitz, published in the History of your Academy. He has not yet acknowledged that I gave, in the first proposition of the Book of Quadratures, published in 1693 by Wallis, and in 1686 in Lem. 2, book ii. of the *Principia*, synthetically demonstrated, the true rule for differentiating differences; and that I had in the year 1672 the rule for determining the curvature of curves. He has not yet acknowledged that, in the year 1669, when I wrote the Analysis by series, I

¹ Pages 32-36.

² See APPENDIX, No. XIX.

³ Sept. 26, 1721, c. s.

had a method of accurately squaring curve lines when it could be done, and which is explained in my letter to Oldenburg, dated 24th October 1676, and in the Fifth Prop. of the Book of Quadratures ; and also that Tables of Curvatures, which could be compared with the Conic Sections, were composed by me at that time. If these things were admitted, it would put an end to all disputes, and I could not then easily refuse him my picture."

In replying to this letter, Varignon says,¹ "I sent to Bernoulli, on the 21st October, the portions of your letter relating to his complaints, with the addition that you prohibited me from publishing them ; but I took no notice of the conditions which you considered necessary before you granted him your picture, lest they should have annoyed him. In order, however, that you might still appear friendly to him, I informed him that three copies of your *Optics*, now in the press, were destined for himself, his son, and his nephew ; and, indeed, in his last letter from Basle of the 22d November, he desires me to present to you, in his name and theirs, their best thanks for the many gifts you intend for them. But the answer which he has made to the parts which I transcribed from your last letter, I dare not communicate to you. I have deemed it better to transcribe it for Demoivre, who will tell it to you, that you may say to him what perhaps you would not wish to write."

From the high character of Varignon, both as a mathematician and an individual, Newton and his rivals were equally anxious to obtain his judgment in their favour. Leibnitz had expressed to Bernoulli his great anxiety that Varignon would do nothing in France that would be injurious to his cause ;² and Bernoulli, in his reply,³ sends him an extract from a letter of

¹ Dated December 9, 1721.

² Spero dominum Varignonium curaturum, te presertim hortatore, ne quid in Gallia fiat de quo queri possim. Aug. 19, 1713, *Com. Epist. Leib. et Bern.* tom. ii. p. 321.

³ September 9, 1713.

Varignon's, in which, while he concedes to Newton an early knowledge of the doctrine of infinitesimals, he gives to Leibnitz the discovery of the differential calculus. Varignon has nowhere given an opposite opinion in his letters to Newton, though he could scarcely have avoided it had any favourable impression been made upon his mind by the information communicated to him, and by his subsequent perusal of the second edition of the *Commercium Epistolicum*, and the *Recensio*. Previous to the publication of this edition, Newton sent him a copy of the second, and, in the following letter, requested his opinion of the preface, and of the annotation at the end of the work.¹

“To the celebrated M. Abbé Varignon,
Prof. of Mathematics in the College Mazarin.

“REVEREND SIR,—I send you a copy of the *Commercium Epistolicum*, reprinted here along with the account of it turned into Latin, and the Judgment of the ‘Primary Mathematician.’ All these were printed long before the death of Leibnitz, but this *Commercium* has not yet been offered for sale in the booksellers’ shops. A preface to the reader is prefixed, and an annotation of which two parts are new, but taken from ancient writings. I earnestly entreat you to read these two, and if you find anything said which ought not to be said, or anything which ought to be said otherwise, and mention it to me, I will take care that it shall be corrected, if necessary, before the book is published. The object of the book is, not that disputes may be revived, but that questions may be rejected which have nothing to do with the subject, and that what has been said respecting the first inventor of the method, either of fluxions, or moments, or differences, may be handed down to posterity, and quietly referred to their judgment. I am getting well slowly, and hope that I shall soon enjoy my usual health.—
Farewell,
IS. NEWTON.”

¹ Varignon had lost his copy of the first edition, from having lent it to a friend. The date of Newton's letter must have been in June or July 1722.

In replying to this letter, the Abbé wisely avoids the question at issue between his friends, and contents himself with making the following observations on the two points to which Newton had called his attention :—“ I lately requested M. Demoivre to mention to you that I had some hesitation about two places in the first preface to the reader, which you begged me to consider, along with the notes on the anonymous epistle, dated 7th June 1713, in which I see nothing calculated to give offence. But it is otherwise in the above-mentioned preface, for, in page 5, there are two things which I think may be offensive.” These two criticisms, which we have given in a note, though very trivial, were attended to in the edition of 1725.¹ This letter, which announced to Newton that the French translation of his *Optics* was completed on the last day of July 1722, was the last which he received from Varignon, who died a few months afterwards, on the 23d December 1722.²

In a preceding chapter we have mentioned the short corre-

¹ “ 1o. Lin. 12, 13. Legitur *Jam velo sublato, ut militem in hac rixa pro se inducere: Mallem simpliciter Jam in hac rixa pro se inducere, ne quis sub illo velo prius latitantem putet Dum. “ 2o. Ibidem, Lin. 29. Legitur de Do. Des Maizeaux *et in lucem edidit: Mallem et me non consulto in lucem edidit* ut nimirum hæc loquendi ratio concilietur cum Epistola quam ad Dum. Bernoullium, tua cum venia nuper scripsi.

“ Hæc sunt quæ te lubente notavi in prædicti libri Præfatione prima ad Lectorem. At in notis ad Epistolam sine nomine datam die 7 Junii 1713, nihil mihi visum est quod sic paci noxium esse possit, ut Jam dixi.” This letter is dated Paris, 4 Aug. 1722.

² Pierre Varignon was born at Caen in 1654. In 1687 he published his *Projet d'une Nouvelle Mécanique*, in consequence of which he was elected a Member of the Academy of Sciences, and appointed Professor of Mathematics in the College Mazarin. Though of a robust constitution, his habits of severe study made such an impression upon it, that, in 1705, his life was for six months in great danger, and during the three following years, he was in a state of constant languor and fever, during the attacks of which, as he told Fontenelle, he believed that he was in the middle of a forest, where he saw the leaves of all the trees covered with algebraic calculations. After teaching his class at the College Mazarin, on the 22d December 1722, he was seized with an illness which carried him off on the following night. Newton contributed the plate for the portrait of Varignon to the edition of his *Mécanique*, republished in 1725, as a present to the friends of Varignon.

spondence which took place between Newton and John Bernoulli, and have quoted those portions of it which bear upon the Fluxionary controversy.¹ It commenced on the part of Bernoulli with a letter of thanks² for the copy of Newton's *Optics*, which he had received through Varignon, and for the copy of the Latin edition which was promised him, with apologies for the delay that has taken place in writing him, which he hopes he will not impute to any insensibility to his divine and unrivalled genius. He appeals to his correspondence with Montmort and Demoivre for a proof of his admiration of his talents and his affection for his character, and he cannot understand how it has happened that—after the torch had been lighted of that deadly war, which, to the disgrace of mathematical science, has raged for three years between the geometers of Britain and Germany—he, neither a Briton nor a German, but a Swiss, who belonged to no party, and would have done anything rather than voluntarily intermeddle with the disputes of others, should have fallen, as was reported, in his esteem. If such should be the case, which he cannot believe, he must ascribe it to a combination of sycophants who seek to advance their own reputation and that of their friends, by destroying the good name of others, and proscribing all who are not English, the innocent and the guilty, unless they are willing to applaud them in everything. He believes, therefore, that many falsehoods have been told which have sunk him in his esteem, and, in defence of himself, he appeals to his writings, and declares that in these as well as in his letters, his conversations, his orations, and his lectures, he has always extolled him and his inventions with the highest praise. Nor can he doubt that such sincere appreciation of his talents will be more agreeable to posterity “than that immoderate ardour (not of praising you, for you cannot be too much praised) of arrogating to you what you do not claim, and leaving nothing to foreigners.” This extravagant praise, which could not but be offensive to Newton, is

¹ Pages 32, 33.

² Dated July 5, 1719. See APPENDIX, No. XX.

followed by the solemn denial (the substance of which we have already quoted)¹ that he was the author of the celebrated letter in the *Charta Volans*, which he understood Newton had, on the authority of Leibnitz, ascribed to him in Raphson's *Fluxions*. He makes the best apology he can for Leibnitz's disregard of his feelings in ascribing the letter to him, and he concludes with an ardent expression of his gratitude to Newton for his splendid presents, and for his admission into the Royal Society, begging that he will regard him as "a most zealous worshipper of his immortal merits."

In Newton's reply to this letter,² he assures Bernoulli, as we have already seen,³ that as soon as he learned that he was not the author of the obnoxious letter, he wished to cultivate his friendship. He thanks him for his kind reception of his *Optics*, and will endeavour to repay his politeness by mutual friendship. He explains how he suspected him to be the writer of the letter of the 7th June, but hopes, as he is not the author of it, that this will do him no injury. He assures him that the addition to Cor. 1, Prop. xiii. Book I. of the *Principia* was made at the suggestion of Cotes, and was printed in 1709, before the commencement of these disputes, and he concludes with the promise that he will exert himself to put an end to the controversy between his friends and him.

To this letter Bernoulli replied on the 21st December 1719. After referring to the obnoxious letter in the manner we have elsewhere mentioned,⁴ and to the publication of some of Leibnitz's letters, he wishes Newton's countrymen would consider, if the controversy was to be carried on by the testimony of mathematicians, whether or not it would be better that other letters should be produced than those of Leibnitz, who cannot be regarded as a proper witness in his own cause. "I have letters," he adds, "from some learned men from countries

¹ Page 17, note 3.

² I have found the scroll of this letter, but without a date.

³ See p. 33.

⁴ See pp. 33, 34.

which have taken no part in this national contest, and which, if I were to make public, I doubt if such of your countrymen as rate me with so much warmth, proceeding even to gross insults, would have much reason to boast. I have, among other authentic documents, a letter from M. Montmort, a very learned mathematician, lately dead, who, as you know, was, while he lived, attached to no party, being a Frenchman. I have, I say, a copy of a certain letter sent to me by him, which he addressed, on the 18th December 1718, to the celebrated Brook Taylor,¹ and which even of itself might put an end to the greatest part of the controversy, but not according to the views of Taylor and his foreign disciples. I willingly abstain, however, from publishing these letters, provided your countrymen will cease to provoke our patience, which I wish for the sake of peace." Bernoulli then expresses his satisfaction with Newton's statement respecting the corollary in the *Principia*. He explains that he had only spoken against the form of Newton's assertion in the first edition of the work, and he claims to be the first who gave the analysis of the inverse truth, without supposing the direct one to be already known. He then mentions a report brought by a friend of his from England, that he had been expelled from the Royal Society,² and he begs that Newton will let him know whether he was expelled by a decision of the Society, or by the single authority

¹ I have found among Newton's papers a copy of this very interesting letter. Montmort was the particular friend of Brook Taylor, and was much attached to Newton, to whom he sent in 1716 a present of fifty bottles of champagne. That Montmort was, as Bernoulli says, an impartial judge in this matter, can hardly be doubted, and as his letter expresses the opinion of continental mathematicians on the Fluxionary controversy, in a manner at once precise and intelligible, I consider it a duty to give it a place in the Appendix. In consequence of Bernoulli's reference to it in his correspondence with Newton, it has acquired a historical interest. See APPENDIX, No. XXI., where I have prefixed to it Brook Taylor's letter to Sir Isaac, dated 22d April, 1716, in which Montmort's regard for Newton is specially mentioned.

² This friend had seen in the list of Fellows for 1718 the name of Bernoulli; but in a work entitled *Magnæ Britannicæ Notitia*, by John Chamberlayne, the friend of Newton, published in 1718, p. 144, he saw a catalogue of the Fellows containing the name of Bernoulli's nephew, but not his own.

of the Secretary, whom at that time he suspects to be Brook Taylor.

The answer of Sir Isaac to this letter has not been found, but there can be no doubt that he explained to Bernoulli, as I find he did to another foreign member of the Royal Society, who made a similar complaint, that the omission of his name from the list of the Fellows was merely an error of the person who copied it. No farther correspondence seems to have taken place between Newton and Bernoulli till 1723, when the latter acknowledged the receipt of three splendidly bound copies of the French edition of the *Optics*, for himself, his son, and his nephew. In this letter Bernoulli characterizes Newton's theory of light and colours as a discovery which will be more admired by posterity than it was then. He tells him that Hartsoeker had claimed for himself the discovery of the different refrangibility of light, and attacked his theory of the planetary system ; and he expresses his surprise that no Englishman was at hand to defend their illustrious countryman against a " fellow so rude and barbarous." After giving an account of Hartsoeker's attack upon himself founded upon a letter of Newton's, and requesting his assistance in protecting him against the charge,¹ he concludes with thanking him in the name of the celebrated Scheuchzer for the kindness he had shown to his son when in London, and giving him the privilege of conversing with the greatest of philosophers and mathematicians.²

It does not appear that Newton returned any answer to this letter, or that he carried on any correspondence with the other distinguished members of the Bernoulli family. Nicolas, the nephew of John, to whom, as we have seen, Newton presented

¹ See p. 35.

² John Bernoulli was born at Basle on the 7th August 1667, and died there on the 1st of January 1748, in the 81st year of his age. He was one of the most distinguished mathematicians of the last century. He was Professor of Mathematics at Basle, and one of the eight Associates of the Academy of Sciences. Two of his sons, Daniel and Nicolas, to the last of whom Newton sent copies of his *Optics*, were eminent mathematicians. His works were published in 1742 at Lausanne and Geneva, in 4 vols. 4to.

copies of several of his works, had pointed out a mistake in the 10th Prop. of the 2d Book of the *Principia*.¹ He went to London in the summer of 1712, where he met with the kindest reception from Newton and Halley, a circumstance which he speaks of with much gratitude in a letter in which he thanks Newton for a copy of the second edition of the *Principia*.² In the fluxionary controversy he was attacked by Keill, as one of Newton's enemies, but it appears that he denied the imputation in an explanatory letter to Newton, to which he received no answer.³

In the latter part of Newton's life his correspondence was very limited, and with the exception of a few letters from Dr. Robert Smith of Cambridge, Fontenelle,⁴ Dr. Derham,⁵ and others, his other letters possess very little interest. We are informed by Conduitt that he destroyed many of his papers before his death, and it is probable that some of them were letters which he deemed of no importance.

¹ Page 263 of the 1st edit. and p. 232 of the 2d edit. In his letter to the Abbé Varignon, in the autumn of 1719, Newton mentions that N. Bernoulli had pointed out this mistake, and adds, "constructionem propositionis correxi, et correctam ei ostendi, et imprimi curavi non subdole, sed eo cognoscente."—*Macclesfield Correspondence*, vol. ii. p. 437. John Bernoulli had previously shown in 1710, that Newton's result was erroneous when the curve was a circle, and he resumed the subject in the Leipsic Acts for February and March 1703. "It is remarkable," says Mr. Edleston, "that both of these mathematicians mistook the source of the error. They imagined that Newton had taken the coefficients of the successive powers of h in the expansion of $(x + h)^n$ for the successive fluxions of x^x ."—See *Comm. Epist. Leib. et Bern.* tom. ii. p. 229; Bernoulli's *Opera*, tom. i. pp. 489, 509; and Edleston's *Correspondence*, &c., pp. 142, 145, 156, 170.

² Dated Padua, May 31, 1717.

³ I find this fact stated in a letter to Newton from the Scotch mathematician James Stirling, who met with Nicolas Bernoulli when he was at Venice in 1719. The postscript to the letter containing a message from Bernoulli to Newton is interesting. I have given it in APPENDIX, No. XXII.

⁴ See APPENDIX, No. XXIII.

⁵ See APPENDIX, No. XXIV.

CHAPTER XXIII.

The Princess of Wales obtains from Newton a manuscript Abstract of his System of Chronology—The Abbé Conti, at her request, is allowed to take a Copy of it under promise of Secrecy—He gives a Copy to M. Freret of the French Academy, who writes a Refutation of it, and gives it to a Bookseller, who asks Newton's permission to print it—Newton neglects to answer two Letters on the subject—The Abstract and the Refutation of it printed—Newton reprobates the conduct of Conti, and defends his system—It is attacked by Father Souciet, and is defended by Halley—Sir Isaac's larger work on Chronology published after his Death, and dedicated to the Queen by Mr. Conduitt—Pope assists in writing the Dedication—Opinions respecting the Chronology—Sir Isaac's Paper on the form of the most ancient Year—His unpublished Papers on the Julian Year, and the Reformation of the Calendar.

WHEN Sir Isaac Newton was one day conversing with the Princess of Wales on some points of ancient history, in reference to the education of the royal family, he was led to mention to her, and to explain, a new system of chronology which he composed during his residence at Cambridge, where he was in the habit, as he expresses it, "of refreshing himself with history and chronology when he was weary of other studies." The Princess was so much pleased with the ingenuity of his system, that she sent a message by the Abbé Conti, when in England, desiring Sir Isaac to speak with her, and on this occasion she requested a copy of the work which contained his system of chronology. Sir Isaac informed her that it existed only in separate papers, which were not merely in a state of confusion, but contained a very imperfect view of the subject; and he promised in a few days to draw up an abstract of it for her Royal Highness's perusal, and on the condition that it should,

not be communicated to any other person.¹ Some time after the Princess received the manuscript, she requested that the Abbé Conti might be permitted to have a copy of it. Sir Isaac granted her request, and the Abbé was distinctly informed that the manuscript was given to him at the request of the Princess, and with Sir Isaac's leave, and that he was to keep it a secret. It was entitled "A Short Chronicle from the First Memory of Things in Europe to the Conquest of Persia by Alexander the Great." It occupies only twenty-four quarto pages, with an introduction of four pages, in which Sir Isaac states that he "does not pretend to be exact to a year, and that there may be errors of five or ten years, and sometimes twenty, but not much above."

During his residence in England, the Abbé Conti kept his promise of secrecy, but he no sooner reached Paris than he communicated the manuscript to several persons, and among others to M. Freret, a learned antiquary, who not only translated it into French, but added observations of his own, for the purpose of refuting some of its leading results. Sir Isaac knew nothing of this transaction till the month of May 1724, when he received a respectful letter from G. Cavelier, a bookseller in Paris, informing him that a small manuscript had fallen into his hands, which he was assured came from his pen, and that as his name was very highly esteemed throughout Europe, he wished to print it. He had learned, however, that it contained

¹ In order to enjoy the conversation of the most distinguished literary men at that time in England, the "Princess of Wales appointed a particular day in the week, when they were invited to attend her Royal Highness in the evening; a practice which she continued after her accession to the throne. Of this company were Drs. Clarke, Hoadley, Berkeley, and Sherlock. Clarke and Berkeley were generally considered as principals in the debates that arose upon those occasions, and Hoadley adhered to the former as Sherlock did to the latter. Hoadley was no friend to Berkeley: he affected to consider his philosophy and his Bermuda project as the reveries of a visionary. Sherlock (who was afterwards Bishop of London), on the other hand, warmly espoused his cause, and particularly when the 'Minute Philosopher' came out, he carried a copy of it to the Queen, and left it to her Majesty to determine whether such a work could be the production of a disordered understanding."—*Works of George Berkeley, D.D., Bishop of Cloyne*, p. vii. Lond. 1837.

some errors, and as Sir Isaac would probably not wish it to appear under his name, he begged, as the manuscript which he had was of little value, that he would give him a correct copy of *His Chronology*. He added, that several persons who had defective copies would be glad to have correct ones, and as he was a bookseller who desired only to publish good articles, he was persuaded there could be nothing better than what came from his pen.

Sir Isaac took no notice of this letter, the object of which he probably thought was to get money for the manuscript, for he could hardly suppose that a mere pamphlet on a subject by no means popular, and supposed to contain errors, would repay the expenses of publication. After waiting nearly ten months for an answer, Cavelier addressed another letter to Newton, dated March 20, 1725, in which he asks him if he has additions or corrections to make, as some errors have been committed by the translator. He requests an immediate answer, and adds, that if he does not receive one, he will consider his silence as his consent to the publication of the work, "with remarks."¹

As Sir Isaac paid no attention to this second letter, Cavelier requested a friend in London to procure an answer, which he at last received in the following terms:—

"I remember that I wrote a 'chronological index for a particular friend, on condition that it should not be communicated. As I have not seen the MS. which you have under my name, I know not whether it be the same. That which I wrote was not at all done with design to publish it. I intend not to meddle with that which hath been given you under my name, nor to give any consent to the publishing of it.—I am, your very humble servant,

IS. NEWTON.

"London, May 27, 1725. St. Vet."

Before Cavelier received this letter the work was printed,²

¹ These two letters of Cavelier have been preserved by Sir Isaac.

² It was entitled *Abrégé de Chronologie de M. Le Chevalier Newton, fait par lui-même, et traduit sur le manuscrit Anglois.* Paris, 1725.

and a copy of it was sent to Newton as a present, on the 11th November 1725.¹ The pamphlet was accompanied by Freret's observations, and, in an advertisement prefixed to it, Cavalier defends himself for printing it against the author's wishes, on the ground that he had written three letters to obtain his permission, and, in order to insure an answer, had intimated to him that he would take his silence for consent. When Sir Isaac received this work, he drew up a paper entitled, *Remarks on the Observations made on a Chronological Index of Sir Isaac Newton, translated into French by the Observator, and published at Paris*, which was printed in the *Philosophical Transactions*.² In this paper Sir Isaac gives a history of the transaction, charges

¹ The existence of this manuscript in Paris was generally known, and was the subject of conversation before the date of Cavalier's first letter to Newton (May 11, 1724), as appears from the following extract of a letter from M. Montmort (or perhaps from Conti) to Brook Taylor, dated Paris, January 15, 1724 :—

“ On m'a dit aussi que Mr. Newton imprime la Chronologie Raisonnée. Tout le monde l'attend avec bien de l'impatience. Faites luy mes complimens, je vous en prie ; voicy une petit Sonnet que vous luy communiquerez ; j'espère qu'il en sera content ; car il verra l'attraction désigné par l'amour, qui règle le sistème de M. Descartes désigné par Phaeton. Dans le Mémoires de Leipsique, il aura vu si je suis du parti des Allemands.

' Lasciar mi il curro Governar del giorno,'
 Disse à Febo l'Amor, ' e tosto sia
 Rectificata in Ciel l'alta armonia
 Che Fetonte turbó con suo gran scorno
 Io diedi sede al cancro ed al capricorno
 Ed al corpo lunar l'obliqua via
 Io sterno al par del Caos ; ed Io con lumeor
 Forzo al mondo l'equilibro ; ed Io l'adorno.
 Disse : ' e le Briglie imperioso stese
 E corresse l'Aurora, ed agli infinite
 Fonti del lume il corso antico rese
 Ritornó i Pianet' ai primi siti
 Il Solar Orbe a perni scai s'apese
 E tal fu poi qual' O Newton l'additi.

PAR L'ABBOT CONTI."

Contemplatio Philosophica, and Life of Brook Taylor. Lond. 1793, p. 141.

M. Conti is supposed to be the Abbot who corresponded with Lady Mary Wortley Montague. See her *Letters and Works*, vol. i. p. 358, and vol. ii. pp. 11, 21, 119, and 128. See also p. 375.

² *Phil. Trans.* 1725, Vol. xxxiii. No. 389, p. 315. I have found seven distinctly written copies of this paper in Sir Isaac's handwriting.

the Abbé Conti with a breach of promise,¹ and blames the publisher for having asked his leave to print the translation without sending him a copy for his perusal,—without acquainting him with the name of the translator,—and without announcing his intention of printing along with it a refutation of the original. The observations made by the translator against the conclusions deduced by the author, were founded on an imperfect knowledge of Sir Isaac's system ; and they are so specious, that Halley himself confesses that he was at first prejudiced in favour of the Observations, taking the calculations for granted, and not having seen Sir Isaac's work.

To all the observations of M. Freret Sir Isaac returned a triumphant answer. This celebrated writer had ventured to assert, “ that he believed he had stated enough concerning the epoch of the Argonauts, and the length of generations, to make people cautious about the rest ; for these are the two foundations of all this new system of chronology.” He founds his arguments against the epochs of the Argonauts, as fixed by our author, on the supposition that Sir Isaac places the vernal equinox at the time of the Argonautic expedition *in the middle of the sign of Aries*, whereas Sir Isaac places it *in the middle of the constellation*,—a point corresponding with the middle of the back of Aries, or 8° from the first star of Aries. This position of the colure is assigned on the authority of Eudoxus, as given by Hipparchus, who says that the colure passed over the back of Aries. Setting out with this mistake, M. Freret concludes that the Argonautic expedition took place 532 years earlier than Sir Isaac made it. His second objection to the new system relates to the length of generations, which he says is made only eighteen or twenty years. Sir Isaac, on the contrary, reckons a generation at thirty-three years, or three generations at 100 ; and it was the lengths of the reigns of kings that he made eighteen or twenty years. This deduction he

¹ Conti is said to have defended himself with much moderation, and with many expressions of esteem for Newton. See *Bioy. Univ.* tom. ix. p. 517.

finds on the reigns of sixty-four French kings. Now, the ancient Greeks and Egyptians reckoned the length of a reign equal to that of a generation; and it was by correcting this mistake, and adopting a measure founded on fact, that Sir Isaac placed the Argonautic expedition forty-four years after the death of Solomon, and fixed some of the other points of his system.

Sir Isaac concludes his remarks with the following passage:—
 “Abbé Conti¹ came into England in spring 1715, and, while he staid in England, he pretended to be my friend, but assisted Mr. Leibnitz in engaging me in new disputes. The part he acted here may be understood by the character given of him in the *Acta Eruditorum* for 1721. . . . And how Mr. Leibnitz, by his mediation, endeavoured to engage me against my will in new disputes about occult qualities, universal gravity, the sensorium of God, space, time, vacuum, atoms, the perfection of the world, supramundane intelligence, and mathematical problems, is mentioned in the second edition of the *Commercium Epistolicum*. And what he hath been doing in Italy may be understood by the disputes raised there by one of his friends,² who denies many of my optical experiments, though they have been all tried in France with success; but I hope that these things, and the perpetual motion, will be the last efforts of this kind—*will be the last efforts of those friends of Mr. Leibnitz to embroil me.*”³

¹ In the passage from the *Acta Eruditorum*, Conti is described as carrying letters of Newton to Leibnitz, and communicating Leibnitz's letters to Newton. Conti was a very excellent and accomplished person, distinguished as a poet and a man of very considerable acquirements. He was a great favourite of the King, and acted as interpreter when Dr. Clarke, who could speak only Latin and English, was explaining to his Majesty the discoveries of Newton. It was at the King's request that he interfered in the dispute between Newton and Leibnitz, and we see no reason to blame him for the part which he acted in that matter.

² Signior Rizzetti, who afterwards published his attack upon Newton in a book entitled *De Luminis Affectionibus Specimen Physico-Mathematicum*. Venet. 1727.—See Desaguliers' Defence of Newton in the *Phil. Trans.* 1728, p. 596.

³ The words in *italics* are in another copy. I find also from one of these copies that Conti is charged with “sending Mr. Stirling to Italy, a person then unknown to me, to be ready to defend me there, if I would have contributed to his maintenance;” and in

This answer of Sir Isaac's to the objections of Freret called into the field a fresh antagonist, Father Souciet, who published five Dissertations on the new chronology. These Dissertations were written in a tone so highly reprehensible, that Mr. Conduitt being apprehensive that the manner in which his system was attacked would affect Sir Isaac more than the arguments themselves, prevailed upon a friend to draw up, for his perusal, an abstract of Souciet's objections, stripped of the "extraordinary ornaments with which they were clothed." The perusal of these objections had no other effect upon him than to convince him of the ignorance of their author; and he was induced to read the entire work, which produced no change in his opinion.

In consequence of these discussions, Sir Isaac was prevailed upon to prepare his larger work for the press. After the publication of Freret's Observations, he had resolved to print it "as privately as possible, and keep the copies in his own possession," but it was not ready till nearly the time of his death. It did not therefore appear till 1728, when it was published by Mr. Conduitt under the title of the *Chronology of Ancient Kingdoms amended, to which is prefixed a short Chronicle, from the First Memory of Things in Europe to the Conquest of Persia by Alexander the Great*.¹ It consists of six chapters:— 1. On the Chronology of the Greeks; ² 2. Of the Empire of Egypt; 3. Of the Assyrian Empire; 4. Of the two contem-

another, Conti is said to have "softened the business, by lately writing a poem upon him, and in the colour of a friend." This poem is probably that mentioned by Bolingbroke in a letter to Brook Taylor, Dec. 26, 1723. "He has begun a philosophical poem which will be finished, I believe, long before the Anti-Lucretius of the Cardinal de Polignac. Sir I. Newton's system will make the principal beauty in it. He recited the Exorde to me, which I thought very fine. I need not tell you that he writes in Italian." — *Life of Brook Taylor*, p. 136.

¹ The work is dedicated to the Queen by Mr. Conduitt, in an address of twelve quarto pages, in composing which he sought the assistance of Pope. We have given Pope's letter, containing his criticisms, in the APPENDIX, No. XXV.

² According to Whiston, Sir Isaac wrote out eighteen copies of this chapter with his own hand, differing little from one another.— *Whiston's Life*, p. 39.

porary Empires of the Babylonians and Medes ; 5. A Description of the Temple of Solomon ; 6. Of the Empire of the Persians. The sixth chapter was not copied out with the other five, which makes it doubtful whether or not it was intended for publication ; but as it was found among his papers, and appeared to be a continuation of the same work, it was thought right to add it to the other five chapters.¹

After the death of Newton, Dr. Halley, who had not yet seen the larger work, felt himself called upon, both as Astronomer-Royal and as the friend of the author, to reply to the first and last dissertations of Father Souciet, which were chiefly astronomical ; and in two papers² he has done this in a most convincing and learned argument.

Among the supporters of the views of Newton, we may enumerate Dr. Reid, Nauze, and some other writers ; and among its opponents, M. Freret, who left behind him a posthumous work on the subject,³ M. Fourmond, Mr. A. Bedford, Dr. Shuckford, Dr. Middleton, Whiston,⁴ and the late M. Delambre. The object of M. Fourmond is to show the uncertainty of the astronomical argument, arising on the one hand from the vague account of the ancient sphere as given by Hipparchus ; and, on the other, from the extreme rudeness of ancient astronomical observations. Delambre has taken a similar view of the subject : he regards the observations of ancient astronomers as too incorrect to form the basis of a system of chronology ; and he maintains, that if we admit the accuracy of the details in the sphere of Eudoxus, and suppose them all to belong to the same epoch, all the stars which it contains ought at that epoch to be

¹ This work forms the first article in the fifth volume of Dr. Horsley's edition of Newton's works, and is accompanied with copious notes. The next article in the volume is entitled, " A Short Chronicle from a MS., the property of the Reverend Dr. Ekins, Dean of Carlisle," which is nothing more than an abstract of the chronology already printed in the same volume. We cannot even conjecture the reasons for publishing it especially as it is less perfect than the abstract, two or three dates being wanting.

² *Phil. Trans.*, 1727, vol. xxxiv. pp. 205, 296.

³ *Défense de la Chronologie contre le Système de M. Newton.* Paris, 1758, 4to.

⁴ Collection of *Authentic Records*, Part II. No. 24. 1727.

found in the place where they are marked, and we might thence verify the accuracy, and ascertain the state of the observations. It follows, however, from such an examination, that the sphere would indicate almost as many different epochs as it contains stars. Some of them even had not, in the time of Eudoxus, arrived at the position which had been for a long time attributed to them, and will not even reach it for 300 years to come, and on this account he considers it impossible to deduce any chronological conclusions from such a rude mass of errors.

But, however well founded these observations may be, we agree in opinion with M. Daunou,¹ “that they are not sufficient to establish a new system, and we must regard the system of Newton as a great fact in the history of chronological science, and as confirming the observation of Varro, that the stage of history does not commence till the first Olympiad.”

Among the chronological writings of Sir Isaac Newton, we must enumerate his *Letter to a person of distinction who had desired his opinion of the learned Bishop Lloyd's Hypothesis concerning the Form of the most Ancient Year*. This hypothesis was sent by the Bishop of Worcester to Dr. Prideaux. Sir Isaac remarks, that it is filled with many excellent observations on the ancient year; but he does not “find it proved that any ancient nations used a year of twelve months and 360 days without correcting it from time to time by the luminaries to make the months keep to the course of the moon, and the year to the course of the sun, and returns of the seasons and fruits of the earth.” After examining the years of all the nations of antiquity, he concludes, “that no other years are to be met with among the ancients but such as were either lunisolar, or solar or lunar, or the calendars of these years.” A practical year, he adds, of 360 days, is none of these. The beginning of such a year would have run round the four seasons in seventy years, and such a notable revolution would

¹ See an excellent view of this controversy in an able note by M. Daunou, attached to Biot's *Life of Newton in the *Bior. Universelle**, tom. xxxi. p. 180.

have been mentioned in history, and is not to be asserted without proving it.¹

When the public attention was called to the reformation of the Kalendar, Sir Isaac seems to have been consulted on the subject. Among his papers he has left two copies, one distinctly written out as if for publication, entitled *Considerations about rectifying the Julian Kalendar*.² After giving an account of the Egyptian Kalendar—the improvements introduced by Julius Cæsar and the Roman senate, and the correction made by Gregory XIII.—he describes what in another manuscript he calls the best form of the solar year. “The best form of the solar year,” he says, “is to divide it by the four cardinal periods of the equinoxes and solstices, so that the quarters of the year may begin at the equinoxes and solstices as they ought to do, and then to divide every quarter into three equal months, which will be done by making the six winter months to consist of thirty days each, and the six summer months of thirty-one days each, excepting one of them, suppose the last, which in the leap years shall have thirty-one days, in the other years only thirty days. At the end of every 100 years, omit the intercalary day in the leap year, excepting at the end of every 500 years. For this rule is exacter than the Gregorian, of omitting it at the end of every 100 years, excepting at the end of every 400 years, and thus reckoning by 500ds and thousands of years is rounder than the other by 400, 800, and 1200ds. And this I take to be the simplest, and in all respects the best form of the civil year that can be thought of.”

In the paper entitled *Considerations, &c.*, in which the

¹ This letter was first published without any date in the *Gentleman's Magazine* for 1755, vol. xxv. p. 3. I have found two copies of it among Sir Isaac's papers. Mr. Edleston informs us that the original is in the British Museum, presented by Mrs. Sharp. I have found also two copies of the communication he made to the Bishop of Worcester, which is published by Mr. Edleston in his *Correspondence, &c.*, Appendix, p. 314. One of these copies is much fuller than that which is printed by Mr. Edleston.

² I infer that this paper was written in 1699, from the statement in it that Pope Gregory's corrections “were made 118 years ago.”

above form of the civil year is stated less fully, he goes on to consider the best method of introducing a change of style.

“But without the consent of a good part of Europe,” he says, “I do not think it advisable to alter the number of days in the month. The question is now whether the old style should be retained in conformity with antiquity, or the new received in conformity with the nations abroad. I press neither opinion; but whenever the latter shall be resolved upon, I believe the best way may be, to receive the new style without the Gregorian Kalendar by an Act of Parliament, to some such purpose as that which follows.”¹

¹ I find two copies of another paper in Latin, entitled *Regulæ pro determinatione Paschæ*. The subject of the Kalendar is touched upon in Newton's *Chronology*, p. 71, and in his *Observations on the Prophecies of Daniel*, p. 137, note.

CHAPTER XXIV.

Theological Writings of Newton—Their importance to Christianity—Motives to which they have been ascribed—Biot's opinion disproved—The date of Newton's theological writings fixed—His Letters to Locke on these subjects—History of his Account of Two Corruptions of the Scriptures—His observations on the Prophecies of Daniel, and on the Apocalypse—Abstract of his Historical Account of Two Corruptions of Scripture—His views adopted by the ablest Biblical critics of modern times—His unpublished theological writings—Paradoxical questions concerning Athanasius—His Irenicum or Ecclesiastical Polity tending to Peace—His views on points of Trinitarian doctrine—His Articles of Faith—His Plan for correcting the Romish tendencies of the Church of England—Coincidence of his opinions with those of Locke—His views on the future residence of the Blest—Opinions of Voltaire and others—Napier, Boyle, Milton, and Locke, students of the Scriptures—Analogy between the Book of Nature and that of Revelation—Letter of Dr. Morland to Newton.

IF Sir Isaac Newton had not been distinguished as a mathematician and a natural philosopher, he would have enjoyed a high reputation as a theologian. The occupation of his time, however, with those profound studies, for which his genius was so peculiarly adapted, and in the prosecution of which he was so eminently successful, prevented him from preparing for the press the theological works which he had begun at a very early period of life, and to which he devoted much of his time even when he mixed with the world, and was occupied with the affairs of the Mint. The history of Sir Isaac's theological writings cannot fail to be regarded as an interesting portion of his life, and much anxiety has been expressed for a more precise account than has yet been given of his religious opinions. That the greatest philosopher of which any age can boast was a sincere and humble believer in the leading doctrines of our religion, and lived conformably to its precepts, has been justly

regarded as a proud triumph of the Christian faith. Had he exhibited only an outward respect for the forms and duties of religion, or left merely in his dying words an acknowledgment of his belief, his piety might have been regarded as a prudent submission to popular feeling, or as a proof of the decay or the extinction of his transcendent powers; but he had been a searcher of the Scriptures from his youth, and he found it no abrupt transition to pass from the study of the material universe to an investigation of the profoundest truths, and the most obscure predictions, of holy writ.

The religious opinions of great men—of those especially who, by force of genius and patient thought, have discovered new and commanding truths—possess an interest of various kinds. The apostle of infidelity cowers beneath the implied rebuke. The timid and the wavering stand firmer in the faith, and the man of the world treats the institutions of religion with more respect and forbearance. Nor are such opinions less influential when they emanate from men who follow truth through her labyrinth, neither impelled by professional ambition, nor alarmed by articles which they have to sign, or creeds which they have to believe. Though often solicited by its highest dignitaries, Newton never thought of entering the Church. He had, therefore, no beacons to dread, and no false lights to mislead him. He was free to range through the volume of inspiration, and to gather from the Sibylline pages of its prophets and apostles, its historians and its poets, the insulated truths which they reveal, and to combine them into a broader faith, and embalm them in a higher toleration.

To the friends and countrymen of Newton it has been no inconsiderable source of pain that some foreign writers have referred to extraordinary causes his religious opinions and theological writings. While some have ascribed them to the habits of the age in which he lived, and to a desire of promoting civil liberty by turning against the abettors of irresponsible power the sharp weapons which the Scriptures supply, others have

endeavoured to show that they were composed at a late period of life when his mind was in its dotage, or had suffered from that supposed mental aberration to which so many acts of his life have been erroneously ascribed. In answer to such allegations, we may adduce the testimony of one of his most distinguished friends, John Craig, an eminent mathematician, who, in the very year in which Newton died, gave the following account of his theological writings:¹—

“I shall not tell you what great improvements he made in geometry and algebra, but it is proper to acquaint you that his great application in his inquiries into nature did not make him unmindful of the Great Author of nature. They were little acquainted with him who imagine that he was so intent upon his studies of geometry and philosophy as to neglect that of religion and other things subservient to it. And this I know, that he was much more solicitous in his inquiries into religion than into natural philosophy, and that the reason of his showing the errors of Cartes’ philosophy was, because he thought it was made on purpose to be the foundation of infidelity. And Sir Isaac Newton, to make his inquiries into the Christian religion more successful, had read the ancient writers and ecclesiastical historians with great exactness, and had drawn up in writing great collections out of both; and to show how earnest he was in religion, he had written a long explication of remarkable parts of the Old and New Testament, *while his understanding was in its greatest perfection, lest the infidels might pretend that his applying himself to the study of religion was the effect of dotage.* That he would not publish these writings in his own time, because they showed that his thoughts were sometimes different from those which are commonly received, which would engage him in disputes; and this was a thing which he avoided as much as possible. But now it’s hoped that the worthy and ingenious Mr. Conduitt will take care that they be published, that the world may see that Sir Isaac New-

¹ Letter to Conduitt, dated 7th April 1727. See vol. i. Appendix, p. 422.

ton was as good a Christian as he was a mathematician and philosopher."

The anxiety to refer the religious writings of Newton to a late period of his life, seems to have been particularly felt by M. Biot, who goes so far as to fix the date of one of his most important works,¹ and to associate his religious tendencies with the effects of what he calls "the fatal epoch of 1693."

"From the nature of the subject," says he, "and from certain indications which Newton seems to give at the beginning of his dissertation, we may conjecture with probability that he composed it at the time when the errors of Whiston and a work of Clarke on the same subject, drew upon them the attacks of all the theologians of England, which would place the date between the years 1712 and 1719. It would then be a prodigy to remark, that a man of from seventy-two to seventy-five years of age was able to compose, *rapidly* as he leads us to believe, so extensive a piece of sacred criticism, of literary history, and even of bibliography, where an erudition the most vast, the most varied, and the most ready, always supports an argument well arranged and powerfully combined. . . . At this epoch of the life of Newton, the reading of religious books had become one of his most habitual occupations; and after he had performed the duties of his office, they formed, along with the conversation of his friends, his only amusement. He had then almost ceased to care for the sciences, and, as we have already remarked, since the fatal epoch of 1693, he gave to the world only three really new scientific productions, of which one had probably been long ready, while the others required from him only a very little time."²

Notwithstanding the prodigy which it involves, M. Biot has adopted 1712-1719 as the date of this critical dissertation;—

¹ *Historical Account of Two Notable Corruptions of the Scriptures*, 50 pp. quarto.

² The papers here alluded to were one on the Scale of Heat, his Reflecting Sextant, and his Solution of the Problem of Quickest Descent. See *Bibl. Univ.*, tom. xxxi. p. 190; and *ante*, vol. i. pp. 208, 349.

it is regarded as the composition of a man of seventy-two or seventy-five ;—the reading of religious works is stated to have become one of his most habitual occupations, and such reading is said to have been his only amusements ; and all this is associated with “the fatal epoch of 1693,” as if his illness at that time had been the cause of his abandoning science and betaking himself to theology.

The incorrectness of these opinions we are fortunately able to prove. It appears from Mr. Pryme’s manuscript,¹ that previous to 1692, when a shade is supposed to have passed over his gifted mind, Newton was well known by the appellation of an “excellent divine,”² a character which could not have been acquired without the devotion of many years to theological researches ; but, important as this argument would have been, we are not left to so general a defence. The correspondence of Newton with Locke, places it beyond a doubt that he had begun his researches respecting the prophecies before the year 1691,—before the forty-ninth year of his age, and before the “fatal epoch of 1693.” The following letter shows, that he had previously discussed this subject with his friend.³

“CAMBRIDGE, Feb. 7, 1690-1.

“SIR,—I am sorry your journey proved to so little purpose, though it delivered you from the trouble of the company the day after. You have obliged me by mentioning me to my friends at London, and I must thank both you and my Lady Masham for your civilities at Oates, and for not thinking that I made a long stay there. I hope we shall meet again in due time, and then I should be glad to have your judgment upon some of my mystical fancies. The Son of Man (Dan. vii.), I take to be the same with the Word of God upon the White

¹ See p. 90.

² In a book called “Newton’s Waste Book,” containing his discoveries in mathematics in the years 1664 and 1665, there are many extracts which prove that he had in these years prosecuted the study of theology.

³ Lord King’s *Life of Locke*, vol. i. p. 402, 2d edit. Lond. 1850.

Horse in Heaven (Apoc. xii.), for both are to rule the nations with a rod of iron; but whence are you certain that the Ancient of Days is Christ? Does Christ anywhere sit upon the throne?—If Sir Francis Masham be at Oates, present, I pray, my service to him, with his lady, Mrs. Cudworth, and Mrs. Masham. Dr. Covell is not in Cambridge.—I am your affectionate and humble servant,

IS. NEWTON.

“Know you the meaning of Dan. x. 21? *There is none that holdeth with me in these things but Mich. your Prince.*”

In replying to this letter, Locke does not seem to have distinctly noticed Newton's question, why he thought that Christ was the Ancient of Days, for in another letter¹ addressed to Locke, he says, “Concerning the *Ancient of Days*, Dan. vii., there seems to be a mistake either in my last letter or in yours, because you wrote in your former letter that the Ancient of Days is Christ; and in my last I either did, or should have asked how you knew that. But these discourses may be done with more freedom at our next meeting.”

It is obvious from these facts, that Locke and Newton had corresponded on the prophecies of Daniel so early as 1691, and that these subjects were discussed by them when they met. In replying to some questions of Locke on the subject of miracles, Newton tells him² that “miracles of good credit continued in the Church for about two or three hundred years. Gregorius Thaumaturgus had his name from them, and was one of the latest who was eminent for that gift, but of their number and frequency I am not able to give you a just account;” and he resumes the subject in the following interesting letter:—

“CAMBRIDGE, May 3, 1692.

“SIR,—Now the churlish weather is almost over, I was thinking within a post or two, to put you in mind of my desire to see you here, where you shall be as welcome as I can make

¹ Dated Cambridge, June 30, 1691.

² Cambridge, Feb. 16, 1691-2.

you. I am glad you have prevented me, because I hope now to see you the sooner. You may lodge conveniently either at the Rose Tavern or Queen's Arms Inn. I am glad the edition is stopped, but do not perceive that you had mine, and therefore have sent you a transcript of what concerned miracles, if it come not now too late ; for it happens that I have a copy of it by me. Concerning miracles, there is a notable passage or two in Irenæus, L. 22, c. 56, recited by Eusebius, I. 5, c. 17. The miraculous refection of the Roman army by rain, at the prayers of a Christian legion (thence called fulminatrix), is mentioned by Ziphilina apud Dionam. in Marco Imp., and by Tertullian, Apolog. c. 5, and ad Scap. c. 4, and by Eusebius, I. 5, c. 5, Hist. Eccl., and in Chronico, and acknowledged by the Emperor Marcus in a letter, as Tertullian mentions. The same Tertullian somewhere challenges the heathens to produce a demoniac, and he shall produce a man who shall cast out the demon. For this was the language of the ancients for curing lunatics. I am told that Sir Henry Yelverton, in a book about the truth of Christianity, has writ well of the ancient miracles, but the book I never saw. Concerning Gregory Thaumaturgus, see Gregory Nystra in ejus vita, and Basil, de Spiritu Sancto, c. 29. My humble service to Sir Francis and his lady. I am, your most humble servant,

IS. NEWTON.

“ I know of nothing that will call me from home this month.”

In the early part of 1703, Locke sent to Newton the manuscript of his Commentary on the Epistles of St. Paul to the Corinthians, which have been published among his posthumous works, and in the following letter he gave him his opinion of the work, with a criticism upon his interpretation of a particular passage :¹—

“ LONDON, *May 15, 1703.*

“ SIR,—Upon my first receiving your papers, I read over

¹ “ The words of Locke,” says Lord King, “ stand unaltered in the printed copy,” vol. ii. p. 420.

those concerning the First Epistle of the Corinthians, but by so many intermissions, that I resolved to go over them again, so soon as I could get leisure to do it with more attention. I have now read it over a second time, and gone over also your papers on the Second Epistle. Some faults, which seemed to be faults of the scribe, I mended with my pen as I read the papers ; some others I have noted in the enclosed papers. In your paraphrase on 1 Cor. vii. 14, you say, 'the unbelieving husband is sanctified or made a Christian in his wife.' I doubt this interpretation, because the unbelieving is not capable of baptism, as all Christians are. The Jews looked upon themselves as clean, holy, or separate to God, and other nations as unclean, unholy, or common, and accordingly it was unlawful for a man that was a Jew to keep company with, or come unto one of another nation ; Acts x. 28. But when the propagation of the gospel made it necessary for the Jews, who preached the gospel, to go unto and keep company with the Gentiles, God showed Peter by a vision, in the case of Cornelius, that he had cleansed those of other nations, so that Peter should not any longer call any man common or unclean, and on that account forbear their company ; and thereupon Peter went in unto Cornelius and his companions, who were uncircumcised, and did eat with them ; Acts x. 27, 28, and xi. 3. Sanctifying, therefore, and cleansing, signify here, not the making a man a Jew or Christian, but the dispensing with the law whereby the people of God were to avoid the company of the rest of the world as unholy or unclean. And if this sense be applied to St. Paul's words, they will signify, that although believers are a people holy to God, and ought to avoid the company of unbelievers as unholy or unclean, yet this law is dispensed with in some cases, and particularly in the case of marriage. The believing wife must not separate from the unbelieving husband as unholy or unclean, nor the believing husband from the unbelieving wife ; for the unbeliever is sanctified or cleansed by marriage with the believer, the law of avoiding the company of unbelievers being,

in this case, dispensed with. I should therefore interpret St. Paul's words after the following manner :

“ ‘ For the unbelieving husband is sanctified or cleansed by the believing wife, so that it is lawful to keep him company, and the unbelieving wife is sanctified by the husband ; else were the children of such parents to be separated from you, and avoided as unclean, but now, by nursing and educating them in your families, you allow that they are holy.’ ”

“ This interpretation I propose as easy and suiting well to the words and design of St. Paul, but submit it wholly to your judgment.

“ I had thoughts of going to Cambridge this summer, and calling at Oates in my way, but am now uncertain of this journey. Present, I pray, my humble service to Sir Francis Masham and his lady. I think your paraphrase and commentary on these two Epistles is done with very great care and judgment.—I am, your most humble and obedient servant,

“ IS. NEWTON.”

It is obvious from these letters that Newton had carried on his theological studies, and particularly those relating to the Prophecies, long before the epoch of 1693, and there is no reason to believe that any part of his principal theological work on the Prophecies and the Apocalypse was composed after that date. If any further evidence were required for this fact, it may be derived from his folio *Commonplace Book*, written in his early hand, and containing copious extracts and observations on theological subjects of every kind.

The other work of Newton, entitled *Historical Account of two Notable Corruptions of the Scriptures, in a Letter to a Friend*, is certainly an early production. In 1690, or perhaps earlier, he had corresponded on the subject of it with Locke, who requested a sight of the manuscript. In reply to this request, Newton writes to him,¹ “ that he would have answered

¹ Cambridge, Sept. 28, 1690.

his letter sooner, but that he stayed to revise and send the papers which he desired; but the consulting of authors, proving more tedious than he expected, made him defer sending them till next week." In the following letter to Locke, which accompanies the manuscript, he mentions part of it as something that he "had by him," and it was therefore in all probability written long before 1690:—

November 14, 1690.

"SIR,—I send you now by the carrier, Martin, the papers I promised. I fear I have not only made you stay too long for them, but also made them too long by an addition; for, upon the receipt of your letter reviewing what I had by me concerning the text of 1 John v. 7, and examining authors a little further about it, I met with something new concerning that other of 1 Tim. iii. 16, which I thought would be as acceptable to inquisitive men, and might be set down in a little room; but by searching further into authors to find out the bottom of it, is swelled to the bigness you see. I fear the length of what I say on both texts may occasion you too much trouble, and therefore if at present you get only what concerns the first done into French, that of the other may stay till we see what success the first will have. I have no entire copy besides that I send you, and therefore would not have it lost, because I may, perhaps, after it has gone abroad long enough in French, put it forth in English. What charge you are at about it (for I am sure it will put you to some) you must let me know, for the trouble alone is enough for you. Pray present my most humble service and thanks to my Lord and Lady Monmouth, for their so kind remembrance of me, for their favour is such that I can never sufficiently acknowledge it. If your voyage hold, I wish you a prosperous one, and happy return. I should be glad of a line from you to know that you have these papers, and how far you have recovered your health, for you told me nothing of that.—I am, Sir, your most faithful and most humble servant,

IS. NEWTON."

When this correspondence was going on, Mr. Locke meditated a journey to Holland, and undertook, in compliance with the wishes of his friend, to have the *Historical Account*, &c., translated into French, and published in Holland. Dreading the intolerance of the divines of his own country, he was anxious to have the opinions of foreign biblical writers before he "put it forth in English." Having abandoned his design of visiting Holland, Locke transmitted the manuscript, in his own handwriting,¹ and without Newton's name, to his friend M. Le Clerc in Holland, with a request to have it translated into French and published. Sir Isaac was not aware of the step that Locke had taken; and knowing that he had not left England, he believed that the manuscript was still in his possession. It had reached M. Le Clerc, however, previous to the 11th April 1691, for, in a letter to Locke of that date, he tells him that he will translate, either into Latin or French, the small *Historical Account*, &c., which deserves to be published. "I believe, however," he adds, "that it would be better if the author had read with care what M. Simon has said on the subject, of which he speaks in his Criticism of the New Testament."² In a subsequent letter, Le Clerc tells Locke that he has been prevented, by various occupations, from doing anything with the manuscript, but that he hopes to have an opportunity of publishing it along with some other dissertations, as it is too small to appear alone. In reply to a letter which he had received from Locke, Le Clerc says, "that he will take care to insert in the dissertation on the passage in St. John, the addition which he had sent him, and translate the other, to publish both in Latin."

Locke seems to have intimated the intentions of Le Clerc to Sir Isaac, who lost no time in addressing to him the following letter:—

"CAMBRIDGE, Feb. 16, 1691-2.

"SIR,—Your former letters came not to my hand, but this

¹ Edition of 1754, pp. 122, 123.

² *Hist. Critique du Texte du Nouveau Testament*. Rotterdam, 1689.

I have. I was of opinion my papers had lain still, and am sorry to hear there is news about them. Let me entreat you to stop their translation and impression so soon as you can, for I design to suppress them. If your friend hath been at any pains and charge, I will repay it and gratify him. . . .

“Your most affectionate and humble servant,

“IS. NEWTON.”

From these facts it is obvious that this celebrated treatise, which Biot alleges to have been written between 1712 and 1719, *was actually written in 1690*, or probably much earlier, and was in the hands of Le Clerc on the 11th April 1691, previous to the time of the supposed insanity of its author. Locke lost no time in communicating to his friend the wishes of Newton, and the publication of the *Historical Account* was therefore stopped.

Although we are not acquainted with the reasons which induced Newton to take this step, they may to a certain extent be inferred from Le Clerc's answer to Locke.¹ “It is a pity,” he says, “that these two dissertations should be suppressed. I do not think that any person could find out that they were translated, unless it were said so. In a matter of this kind, where I would not fail to seize the meaning of the author, I would have given it an original air which would not have savoured of a translation.” And, in another letter,² he says, “I will keep carefully the two dissertations, till you tell me what the author wishes me to do with them.”

No information concerning these dissertations is contained either in the correspondence of Locke with Newton, or with Le Clerc. We are told by the editor of the edition of 1754, that Le Clerc deposited the manuscript in the Library of the Remonstrants, and that he received, through a friend, the copy of it which he published, under the title of *Two Letters from Sir Isaac Newton to M. Le Clerc, the former containing a Disserta-*

² July 15, 1692.

tion upon the Reading of the Greek Testament, 1 John v. 7, the latter upon 1 Timothy iii. 16 ;—a form which had never been given to it by its author. The copy thus published was a very imperfect one, wanting both the beginning¹ and the end, and erroneous in many places ; but Dr. Horsley has published a genuine edition, which has the form of a single letter to a friend, and was copied from a manuscript in Sir Isaac Newton's handwriting, now in the possession of the Reverend Jeffrey Ekins, Rector of Sampford.²

Having thus determined, as accurately as possible, the dates of the principal theological writings of Sir Isaac, we shall now proceed to give some account of their contents.

The work entitled *Observations upon the Prophecies of Daniel and the Apocalypse of St. John*,³ is divided into two parts, the first of which treats of the Prophecies of Daniel, and the second of the Apocalypse of St. John. It begins with an account of the different books which compose the Old Testament ; and, as the author considers Daniel to be the most distinct in the order of time, and the easiest to be understood, he makes him the key to all the prophetic books in those matters which relate to the "last time." He next considers the figurative language of the prophets, which he regards as taken "from the analogy between the world natural, and an empire or kingdom considered as a world politic ;" the heavens, and the things therein, representing thrones and dynasties ; the earth, with the things therein, the inferior people ; and the lowest parts of the earth the most miserable of the people. The sun is put for the whole race of kings, the moon for the body of the common people, and the stars for subordinate princes and

¹ The editor supplied the beginning down to the 13th page, where he mentions in a note, that "thus far is not Sir Isaac's."

² I have not found any copy of this *manuscript*, or any letters relating to it, among the manuscripts of Newton. In his list of the MSS., Dr. Horsley mentions a Latin translation of the *Historical Account*, and a paper book entitled *Sancti Johannis Apostoli Vindiciæ contra Novaticos et Falcarios*.

³ Lond. 1733. 4to. Pp. 323.

rulers. In the earth, the dry land and the waters are put for the people of several nations. Animals and vegetables are also put for the people of several regions. When a beast or man is put for a kingdom, his parts and qualities are put for the analogous parts and qualities of the kingdom ; and when a man is taken in a mystical sense, his qualities are often signified by his actions, and by the circumstances and things about him. In applying these principles he begins with the vision of the image composed of four different metals. This image he considers as representing a body of four great nations which should reign in succession over the earth, viz., the people of Babylonia, the Persians, the Greeks, and the Romans, while the stone cut out without hands is a new kingdom which should arise after the four, conquer all those nations, become very great, and endure to the end of time.

The vision of the four beasts is the prophecy of the four empires repeated, with several new additions. The lion with eagles' wings was the kingdom of Babylon and Media, which overthrew the Assyrian power. The beast like a bear was the Persian empire, and its three ribs were the kingdoms of Sardis, Babylon, and Egypt. The third beast, like a leopard, was the Greek empire, and its four heads and four wings were the kingdoms of Cassander, Lysimachus, Ptolemy, and Seleucus. The fourth beast, with its great iron teeth, was the Roman empire, and its ten horns were the ten kingdoms into which it was broken in the reign of Theodosius the Great.

In the fifth chapter Sir Isaac treats of the kingdoms represented by the feet of the image composed of iron and clay which did not stick to one another, and which were of different strength. These were the Gothic tribes called Ostrogoths, Visigoths, Vandals, Gepidæ, Lombards, Burgundians, Alans, &c., all of whom had the same manners and customs, and spoke the same language, and who, about the year 416 A.C., were all quietly settled in several kingdoms within the empire, not only by conquest, but by grants of the Emperor.

In the sixth chapter he treats of the *ten* kingdoms repre-

sented by the ten horns of the fourth beast, into which the Western empire became divided about the time when Rome was besieged and taken by the Goths. These kingdoms were,—

1. The kingdom of the Vandals and Alans in Spain and Africa.
2. The kingdom of Suevians in Spain.
3. The kingdom of the Visigoths.
4. The kingdom of the Alans in Gaul.
5. The kingdom of the Burgundians.
6. The kingdom of the Franks.
7. The kingdom of the Britains.
8. The kingdom of the Huns.
9. The kingdom of the Lombards.
10. The kingdom of Ravenna.

Some of these kingdoms at length fell, and new ones sprung up; but whatever was their subsequent number, they still retain the name of the ten kings from their first number.

The eleventh horn of Daniel's fourth beast is shown in chapter vii. to be the Church of Rome in its triple character of a seer, a prophet, and a king; and its power to change times and laws is copiously illustrated in chapter viii.

In the ninth chapter our author treats of the kingdom represented in Daniel by the ram and he-goat, the ram indicating the kingdom of the Medes and Persians from the beginning of the four empires, and the he-goat the kingdom of the Greeks to the end of them.

The prophecy of the seventy weeks, which had hitherto been restricted to the first coming of our Saviour, is shown to be a prediction of all the main periods relating to the coming of the Messiah, the times of his birth and death, the time of his rejection by the Jews, the duration of the Jewish war, by which he caused the city and sanctuary to be destroyed, and the time of his second coming.

In the eleventh chapter Sir Isaac treats with great sagacity and acuteness of the time of our Saviour's birth and passion,—a subject which had perplexed all preceding commentators.

After explaining, in the twelfth chapter, the last prophecy of Daniel, namely, that of the scripture of truth, which he considers as a commentary on the vision of the ram and he-goat, he proceeds, in the thirteenth chapter, to the prophecy of the king who did according to his will, and magnified himself above every god, and honoured Mahuzzims, and regarded not the desire of women. He shows that the Greek empire, after the division of the Roman empire into the Greek and Latin empires, became the king who, in matters of religion, did according to his will, and in legislation exalted and magnified himself above every god.

In the second part of his work, entitled *Observations on the Apocalypse of St. John*, consisting of three chapters, Sir Isaac treats in the *first* or introductory chapter, "concerning the time when the Apocalypse was written," which he conceives to have been during John's exile in Patmos, and before the Epistle to the Hebrews and the Epistles of Peter were written, which in his opinion have a reference to the Apocalypse. In the *second* he treats "of the relation which the Apocalypse has to the book of the law of Moses, and to the worship of God in the temple;" and in the *third*, "of the relation which the prophecy of John hath to those of Daniel, and of the subject of the prophecy."

Sir Isaac regards the prophecies of the Old and New Testament not as given to gratify men's curiosities, by enabling them to foreknow things, but that, after they were fulfilled, they might be interpreted by the event, and afford convincing arguments that the world is governed by Providence. He considers that there is so much of this prophecy already fulfilled, as to afford to the diligent student sufficient instances of God's Providence; and he adds, that "amongst the interpreters of the last age, there is scarce one of note who hath not made some discovery worth knowing, and thence it seems one may gather that God is about opening these mysteries. The success of others," he continues, "put me upon considering it, and if I

have done anything which may be useful to following writers, I have my design." Such is a brief notice of this ingenious work, which is characterized by great learning, and marked with the sagacity of its distinguished author.¹

The same qualities of Sir Isaac's mind are equally conspicuous in his *Historical Account of Two Notable Corruptions of Scripture*. This celebrated treatise relates to two texts in the Epistles of St. John and St. Paul. The first of these is in 1 John v. 7, "For there are three that bear record in heaven, the Father, the Word, and the Holy Ghost, and these three are one." This text he considers as a gross corruption of Scripture, which had its origin among the Latins, who interpreted the Spirit, Water, and Blood, to be the Father, Son, and Holy Ghost, in order to prove them one. With the same view Jerome inserted the Trinity in express words in his version. The Latins marked his variations in the margins of their books; and in the twelfth and following centuries, when the disputations of the schoolmen were at their height, the variation began to creep into the text in transcribing. After the invention of printing, it crept out of the Latin into the printed Greek, contrary to the authority of all the Greek manuscripts and ancient versions; and from the Venetian press it went soon after into Greece. After proving these propositions, Sir Isaac gives the following paraphrase of this remarkable passage, which is printed in italics.

"Who is he that overcometh the world, but he that believeth that Jesus is the Son of God, that Son spoken of in the Psalms, where he saith, 'Thou art my Son; this day have I begotten thee.' This is he that, after the Jews had long expected him, came, first in a mortal body, by baptism of water, and then in an immortal one, by shedding his blood upon the cross, and rising again from the dead; not by water only, but by water and blood; being the Son of God, as well by his resurrection

¹ Voltaire, who probably never read this work, has erroneously stated that Sir Isaac explained the Revelations in the same manner as all those that went before him.

from the dead (Acts xiii. 33) as by his supernatural birth of the virgin (Luke i. 35). *And it is the Spirit also that, together with the water and blood, beareth witness of the truth of his coming; because the Spirit is truth; and so a fit and unexceptionable witness. For there are three that bear record of his coming; the Spirit which he promised to send, and which was since shed forth upon us in the form of cloven tongues, and in various gifts; the baptism of water, wherein God testified 'this is my beloved Son;' and the shedding of his blood, accompanied with his resurrection, whereby he became the most faithful martyr, or witness, of this truth. And these three, the spirit, the baptism, and passion of Christ, agree in witnessing one and the same thing (namely, that the Son of God is come); and, therefore, their evidence is strong; for the law requires but two consenting witnesses, and here we have three: and if we receive the witness of men, the threefold witness of God, which he bare of his Son, by declaring at his baptism, 'this is my beloved Son,' by raising him from the dead, and by pouring out his Spirit on us, is greater; and, therefore, ought to be more readily received."*

It appears from the introduction to this letter, that Locke, to whom it was addressed, had been reading the "discourses of some late writers on the subject,"¹ and had expressed to Newton a desire "to know the truth of that text of Scripture concerning the testimony of the three in heaven." Without noticing the views of his predecessors, Sir Isaac contents himself with referring to Luther, Erasmus, Bullinger, and Grotius, and some others, as "the more learned and quick-sighted men, who would not dissemble their knowledge" (of the corruption of this text), and to "the generality who were fond of the place for its making against heresy." In the last edition of his Bible,

¹ Among the writers here referred to, Father Sir on was doubtless the most important. In his *Hist. Crit. du Texte du Nouv. Test.* chap. xviii. p. 203; and in his *Hist. Crit. des Versions du Nouv. Test.* chap. xiv., Rott. 1690, he has given the same opinion of the text as Newton.

published by himself, Luther had expunged the text as spurious, but in deference to popular opinion it was restored by his followers. Erasmus too, omitted it in his edition of the New Testament, published in 1516 and 1519,¹ but, as Porson informs us, having promised Lee that he would insert the passage in his text if it was found in a single Greek MS., he accordingly inserted it in his edition of 1522, after learning that it existed in a MS. which is now in Trinity College, Dublin. Dr. Clarke came to the conclusion, "that much stress ought not to be laid upon the passage in any question, because the sense of the Epistle was complete without it,"² and because it was not found in any MS. before the invention of printing, nor cited by any of the numerous writers in the Arian controversy; and Dr. Bentley read a public lecture to prove that the verse in question was spurious. Gibbon, in the third volume of his History, expressed the general opinion of biblical critics upon the subject; and Wetstein and Griesbach adopted the same views. In reply to these authors, Archdeacon Travis entered the field by attacking Gibbon in 1782, and subsequently Newton and Griesbach in 1786.³ Michaelis considered it a sufficient answer to the English divine to say, that "he was indisputably half a century behindhand in critical knowledge;" and Porson, indignant at the presumption of his countryman, exposed his ignorance and errors in the celebrated letters which he addressed to him in 1788, 1789, and 1790.⁴ In referring to these able letters, Sir Charles Lyell remarks, that "by them the question was for ever set at rest."⁵ Had it been a question in science, it might

¹ In stating this fact, Sir Charles Lyell omits to mention the re-insertion of the text in the edition of 1522. He is mistaken in saying, after Porson, that Newton's Dissertation was written between 1690 and 1760 (a typographical error for 1700), as it was written in 1690, or much earlier, as we have shown.

² Clarke's *Works*, vol. iv. p. 121.

³ In letters in the *Gent. Magazine*, reprinted and enlarged in 1784 and 1786.

⁴ Five of these letters appeared in the *Gent. Magazine* for 1788, and were reprinted with some others, and entitled "*Letters to Mr. Archdeacon Travis*," &c. By R. Porson. Lond. 1790. 8vo. Pp. 406.

⁵ *Second Visit to the United States*, vol. i. p. 122.

have been expected that presumptuous error, when once sternly refuted, would not dare to reappear ; but theological questions are never set at rest, and the very corruption of the sacred text which Sir Charles characterizes as having been “given up by every one who has the least pretension to scholarship and candour,” has been defended in our own day by Dr. Burgess, Bishop of St. David’s, and afterwards of Salisbury, with a boldness of assumption, and a severity of intolerance, unworthy of a Christian divine.¹

The other notable corruption of Scripture discussed by Sir Isaac, is that which he charges the Greeks with having perpetrated in the text of St. Paul,² *Great is the mystery of godliness, God manifest in the flesh.* According to him this reading was effected by changing ó into Θc, the abbreviation of Θεος, . . . whereas all the churches for the first four or five hundred years, and the authors of all the ancient versions, Jerome as well as the rest, read, ‘Great is the mystery of godliness which was manifested in the flesh.’ For this is the common reading of the Ethiopic, Syriac, and Latin versions to this day, Jerome’s manuscripts having given him no occasion to correct the old vulgar Latin in this place.”

After showing that the corruption in question took place in the sixth century, Sir Isaac thus sums up his arguments :—“The difference between the Greek and the ancient version puts it past dispute that either the Greeks have corrupted their MSS., or the Latins, Syrians, and Ethiopians their versions ; and it is more reasonable to lay the fault upon the Greeks than upon the other three, for these considerations :—It was easier for one nation to do it than for three to conspire,—it was easier to change a letter or two in the Greek than six words in the Latin. In the Greek the sense is obscure,—in the versions

¹ *Tracts on the Divinity of Christ*, pp. xc. 371, 372, Lond. 1820 ; and *Introduction to the Controversy on the disputed verse in St. John*, Salisbury, 1835, &c. An able reply to Dr. Burgess, said to be written by the Bishop of Ely, appeared in the *Quarterly Review*, March 1826, vol. xxxiii. p. 64. See *Notes and Queries*, vol. i. pp. 399 and 453.

² 1 Timothy iii. 16.

clear. It was agreeable to the interest of the Greeks to make the change, but against the interest of other nations to do it, and men are never false to their own interest. The Greek reading was unknown in the times of the Arian controversy, but that of the versions was then in use both among Greeks and Latins. Some Greek MSS. render the Greek reading dubious, but those of the versions, hitherto collated, agree. There are no signs of corruption in the versions, hitherto discovered, but in the Greek we have showed you particularly when, on what occasion, and by whom the text was corrupted."¹

The view taken of this text by Sir Isaac has been defended by Dr. Clarke,² Whiston,³ Semler,⁴ Griesbach,⁵ Wetstein, and others. In our own day it has been controverted, with much ability and learning, in an elaborate dissertation by Dr. Henderson,⁶ who has not justified its retention as a portion of revealed truth.⁷

As the tendency of the *Historical Account*, &c., was to deprive the defenders of the doctrine of the Trinity of the aid of two leading texts, Sir Isaac Newton has been regarded by the Socinians and Arians, and even by some orthodox divines, as an Antitrinitarian; but this opinion is not warranted by anything which he has published.⁸ "In the Eastern nations,"

² *Works*, vol. iv. p. 47.

³ *Memoirs*, p. 365.

⁴ *Historical Collections* cited by Michaelis, vol. iv. p. 425.

⁵ *Symbolæ Criticæ*, vol. i. p. 8.

⁶ *The Great Mystery of Godliness incontrovertible, or Sir Isaac Newton and the Socinians Foiled*, &c. By E. Henderson, Professor of Divinity in Highbury College. Lond. 1730.

⁷ The latest writers on the subject, although not Unitarian, namely, Dr. Davidson in his *Treatise on Biblical Criticism*, vol. ii. p. 382, Edin. 1852, and Dr. Tregelles in his *Account of the Printed Text of the Greek New Testament*, p. 226, Lond. 1854, have adopted the views of Sir Isaac.

⁸ There are certainly, as Professor De Morgan has shown, two or three expressions in the Dissertation which a believer in the doctrine of the Trinity is not likely to have used; but while I freely make this admission, I think Mr. De Morgan will also admit that they would not justify us in considering Newton as an Antitrinitarian. They warrant us only to *suspect* his orthodoxy. See Professor De Morgan's *Life of Newton*, p. 113, note.

he says, "and for a long time in the Western, the faith subsisted without this text, and it is rather a danger to religion than an advantage to make it now lean upon a bruised reed. There cannot be better service done to the truth than to purge it of things spurious; and, therefore, knowing your prudence and calmness of temper, I am confident I shall not offend you by telling you my mind plainly, especially since it is no article of faith, no point of discipline, nothing but a criticism concerning a text of Scripture, which I am going to write about."

Although it is obvious that, in allowing his Dissertation to be published in Holland, Sir Isaac did not consider himself as supporting the Socinians or the Arians, yet it cannot be doubted that he was afraid of being known as the author of the work, and of holding the opinions which it advocates. The name of the author was never communicated to Le Clerc, but he no doubt learned it from the writings of Whiston,¹ who, after Newton's death, mentioned the Dissertation as his production. After the death of Le Clerc, Wetstein² placed Locke's copy of it in the Library of the Remonstrants, and endeavoured in vain to procure, from Newton's heirs, the parts that were deficient in the original.

It does not appear that Newton was charged with being an Arian during his lifetime. Whiston indeed tells us, that he "afterwards³ found that Sir Isaac Newton was so hearty for the Baptists, as well as for the Eusebians or Arians, that he sometimes suspected these two were the two witnesses in the Revelations;" and Hopton Haynes, who was employed in the Mint, and who was himself a Humanitarian,⁴ mentioned to Richard Baron,⁵ that Newton held the same doctrine as him-

¹ *Authentic Records*, p. 1077. Lond. 1728.

³ After 1712.—*Memoirs*, &c., p. 206.

⁴ The Humanitarians believe in the humanity of our Saviour, and that he was not an object of prayer.

⁵ "The Unitarian minister, Richard Baron," says Professor De Morgan, "who was a friend of Haynes, states the preceding as having passed in conversation between him and Haynes. The statement is made in the preface of the first volume of his collection of

self.¹ In so far as the opinions of Newton, Locke, and Clarke, all of whom were suspected of Arian tendencies, were hostile to the doctrine of the Trinity, they had substantial reasons for keeping them secret. In the Toleration Act passed in 1688,² before Newton had sent his Dissertation to Locke, an exception was made of those who wrote against "the doctrine of the blessed Trinity;" and in the Act for the Suppression of Blasphemy and Profaneness,³ it was provided, that whoever "by printing, teaching, or advisedly speaking, denied any one of the persons of the Holy Trinity to be God," should, "for the first offence, be disabled to have any office or employment, or any profit appertaining thereunto." The expulsion of Whiston from the University of Cambridge in 1711, for holding Arian tenets, though the Queen did not confirm the censure passed by the Convocation,⁴ was yet a warning to Antitrinitarians of every class who either held office, or were desirous of holding it, to refrain from the public expression of their opinions; and we have no doubt that Newton was influenced by motives of this kind when he desired Locke "to stop the translation and impression of his papers," and mentioned "his design to suppress them."⁵

tracts, called 'A Cordial for Low Spirits' (three vols. Lond. 1763, edit. 3d, 12mo), published under the name of Thomas Gordon. This is not primary evidence like that of Whiston, and it loses force by the circumstance, that in the posthumous work which Mr. Haynes left on the disputed points (and which was twice printed), there is no allusion to it.—*Life of Newton*, p. 110, note.

¹ The author of the *Life of Newton*, in the *Biographia Britannica*, vol. v. p. 3241, says that Newton would not suffer Whiston to be a member of the Royal Society, because he had represented him as an Arian, and, as if to prove this, he refers to Whiston's *Memoirs*, which contain no such statement. Whiston himself assigns another "reason of Sir Isaac Newton's unwillingness to have him a member," namely, "that he was afraid of him the last thirteen years of his life;" but the reason which Whiston assigned to Halley, who asked him "why he was not a member of the Society," was, "Because they durst not choose a heretick."—See Whiston's *Memoirs*, edit. 1749, pp. 206, 292, 293.

² Act, 1 William and Mary, 1688, chap. xviii., sect. 17.

³ Act, 9 & 10 William III., 1698, chap. xxxii.

⁴ Burnet's *History of his own Times*, vol. vi. p. 53, 8vo. 1833.

⁵ In suppressing these papers, Sir Isaac certainly did not "deliberately suppress his

Although a traditionary belief has long prevailed that Newton was an Arian,¹ yet the Trinitarians claimed him as a friend, while the Socinians, by republishing his *Historical Account*, &c., under the title of "Sir Isaac Newton on the Trinitarian Corruptions of Scripture,"² wished it to be believed that he was a supporter of their views. That he was not a Socinian is proved by his avowed belief that our Saviour was the object of "worship among the primitive Christians," and that he was "the Son of God, as well by his Resurrection from the dead, as by his supernatural birth of the Virgin." "He animadverts, indeed," as Dr. Henderson observes,³ "with great freedom, and sometimes with considerable asperity, on the orthodox; but it does not appear that this arose from any hostility to their views respecting the doctrine of the Trinity, or that it was opposed to anything beside the unfair mode in which he conceived they had treated one or two passages of Scripture, with a view to the support of that doctrine."

Influenced by similar views, and in the absence of all direct evidence, I had no hesitation, when writing the Life of Sir Isaac Newton in 1830, in coming to the conclusion that he was a believer in the Trinity;⁴ and in giving this opinion on the creed of so great a man, and so indefatigable a student of Scripture, I was well aware that there are various forms of Trinitarian truth, and various modes of expressing it, which have been received as orthodox in the purest societies of the

opinions," as Dr. Burgess has stated. See Professor De Morgan's *Life of Newton*, p. 115. There is abundance of evidence that he never abandoned the opinions maintained in these papers.

¹ "Newton's religious opinions," says Dr. Thomson, "were not orthodox; for example, he did not believe in the Trinity. This gives us the reason why Horsley, the champion of the Trinity, found Newton's papers unfit for publication; but it is much to be regretted that they have never seen the light."—*Hist. Royal Society*, p. 284.

² Dr. Henderson's *Great Mystery of Godliness*, &c., p. 3.

³ *Ibid.* p. 2.

⁴ M. Biot had previously arrived at the same opinion. "There is absolutely nothing," he says, "in the writings of Newton which can justify, or even authorize the conjecture that he was an Antitrinitarian."—*Biog. Univ.* tom. xxxi. p. 190.

Christian Church. It may be an ecclesiastical privilege to burrow for heresy among the obscurities of thought, and the ambiguities of language, but in the charity which thinketh no evil, we are bound to believe that our neighbour is not a heretic till the charge against him has been distinctly proved. Truth has no greater enemy than its unwise defenders, and no warmer friends than those who, receiving it in a meek and tolerant spirit, respect the conscientious convictions of others, and seek, in study and in prayer, for the best solution of mysterious and incomprehensible revelations. If the HIGHEST authority has assured us "*that no man knoweth the Son but the Father,*" the pretenders to such knowledge impiously presume to be *more than man*.¹

When I examined in 1836 the manuscripts of Sir Isaac Newton at Hurtsbourne Park, I found various theological papers, some of which were so carefully written, and others so frequently copied, that they must have been intended for publication. We have already seen² that Craig, the friend of Newton, urged Conduitt to give these writings to the world. His own niece, Mrs. Conduitt, resolved to publish them herself, "if God granted her life," but "as she might be snatched away before she had leisure to undertake so great a work," she made a codicil to her will,³ charging her executors to submit "them

¹ In order to correct a very grave misrepresentation by Dr. Burgess, Bishop of Salisbury, of the way in which this subject was treated in my former Life of Newton, I am obliged to insert in APPENDIX, No. XXVI. two letters from the Bishop.

² See page 250 of this volume.

³ The following is a copy of the codicil which the Rev. Jeffery Ekins has been so kind as to communicate to me:—"I, Catherine Conduitt, do make and appoint this a Codicil to my last Will and Testament. Whereas, I have in my custody severall Tracts written by Sir Is. Newton, and which I propose to print if God grant me life; but as I may be snatched away before I can have leisure to undertake so great a work, towards publishing of which I design to ask the help of learned men, I will and appoint, and ordain, that my Executor do lay all the tracts relating to Divinity before Dr. Sykes, and in hopes he will prepare them for the press. There are two critical pieces, one on the three *that bear Record in Heaven*, and another upon the Text who thought it *not robbery*, &c., which I will have printed, and there's a piece called *Paradoxical Questions concerning Athanasius*, another the *History of the Creed*, or criticism on it, and a *Church History*

to Dr. Sykes, in hopes that he will prepare them for the press." The manuscripts referred to are—

1. The *Historical Account*, &c., already published.
2. Paradoxical Questions concerning Athanasius.
3. A History of the Creed.
4. A Church History complete.¹
5. Many Divinity tracts.

Mr. Conduitt died a few months after the date of this codicil, and Mrs. Conduitt in January 1739, and there is reason to believe that the papers were never put into the hands of Dr. Sykes. After the marriage of Miss Conduitt to Mr. Wallop, afterwards Lord Lymington, the manuscripts went into their possession, and some of them, including the *Historical Account*, were given by Lady Lymington to her executor, Mr. Jeffery Ekins, from whom they passed successively into the hands of the Dean of Carlisle, the Rector of Morpeth, and the Rev. Jeffery Ekins, rector of Sampford, who now possesses them.

The most complete of the manuscripts above enumerated, is the one entitled *Paradoxical Questions concerning the morals and actions of Athanasius and his Followers*.² It consists of sixteen questions, and possesses a very considerable interest.

compleat, and many more Divinity Tracts, all of them I ordain shall be printed and published, so as they be done with care and exactness; and whatever profit may arise from the same, my dear Mr. Conduitt has given a bond of £2000, to be responsible to the seven nearest of kin to Sir Is. Newton. Therefore the papers must be carefully kept, that no copys may be taken and printed, and Dr. Sykes desired to peruse them here, otherways if any accident comes to them the penalty of the Bond will be levy'd. As the labour and sincere search of so good a Christian and so great a genius, may not be lost to the world, I do charge my Executer to do as I hereby ordain. Witness my hand and seal, the 26 of Jan. 1737.

" CATHERINE CONDUITT."

¹ In a " Catalogue taken of Sir Isaac Newton's MSS., October 15th and 16th, in the year 1777, by William Mann Godschall, Esq., and the Rev. Dr. Horsley," no such manuscript is mentioned. The only MS. of this kind is one of two pages distinctly written and entitled CHAP. VII. of the Rise of the Roman Catholic Church or Ecclesiastical Dominion.

² The manuscript of this work, now before me, is beautifully written in Sir Isaac's own hand, and extends to sixty-two folio pages. It wants the last leaf. I have seen at Hurtsbourne Park a copy in another hand, distinctly written as if for publication. In the Catalogue above mentioned of Newton's MSS. two copies of this MS. are mentioned

“QUEST. 1. Whether the ignominious death of Arius in a boghouse was not a story feigned and put about by Athanasius above twenty years after his death?”

In answer to this question, Newton shows that though Athanasius pretended to have received this account of Arius's death, and of his dying out of communion, from Macarius, yet he invented it himself, and circulated it, “that the miracle of his death being known, it will no longer be doubted whether the Arian heresy be odious to God or not.”

“QUEST. 2. Whether the Meletians deserved that ill character which Athanasius gave them?”

The charge against the Meletians that they were excommunicated for crimes, Sir Isaac considers to be a fiction invented by Athanasius in retaliation for his having been tried at the instance of Inschyras, a Meletian presbyter, and condemned by the Council of Tyre for having broken the communion cup of Inschyras, demolished his church, and afterwards killed Arsenius, the successor of Meletus.

“QUEST. 3. Whether the Council of Tyre and Jerusalem was not an orthodox authentic council bigger than that of Nice?”

Although this council received Arius into communion after he had “disowned the things for which he had been condemned at Nice, and excommunicated Athanasius,” Sir Isaac endeavours to show, with great ingenuity and force of argument, that it was not an Arian council—that it did not profess Arianism, and that it was a full council, and “as authentic as any Greek council ever was or could be since the Apostles' days, they being in communion with the Church Catholic, and legally convened by the letters of Constantine the Great.”

“QUEST. 4. Whether it was a dead man's hand in a bag, or the dead body of Arsenius, which was laid before the Council at Tyre to prove that Arsenius was dead?”

“QUEST. 5. Whether it was Arsenius alive, or only his
in one place, and in another part of the Catalogue another copy is mentioned as *complete*, showing that the other two were not so.

letter which Athanasius produced in the Council of Tyre, to prove that he was not dead ?”

“QUEST. 6. Whether the story of producing the dead man’s hand, and the living Arsenius, in the council of Tyre, was not feigned by Athanasius about twenty-five years after the time of the council ?”

In answering these three questions together, Sir Isaac shows that the dead body of Arsenius was, after exhumation, produced before the Council of Tyre, to prove that he was murdered by Athanasius, who was found guilty and banished as the murderer. In defence of himself, Athanasius invented the story that it was only a dead man’s hand that was produced before the council, and that he refuted the charge by producing Arsenius alive.

“QUEST. 7. Whether the letter of Pinnes for proving Arsenius to be alive was not feigned by Athanasius at the same time with the story of the dead man’s hand ?”

In order to defend Athanasius, a monk confessed that Arsenius had been concealed at Hypseles, and had been sent out of the way to the lower parts of Egypt. Sir Isaac endeavours to show the incorrectness of this story.

“QUEST. 8. Whether the letter of Arsenius was not feigned by Athanasius before the convening of the Council of Tyre ?”

After an ingenious criticism on Arsenius’ letter, Sir Isaac concludes that it is a forgery.

“QUEST. 9. Whether the letter of Inschyras was not feigned by Athanasius ?”

This penitential letter, for having prosecuted Athanasius, addressed to the Blessed Pope Athanasius, is suspected, on very ingenious grounds, to be a forgery.

“QUEST. 10. Whether the recantation of Valens and Ursatius was not feigned by the friends of Athanasius ?”

These recantations are supposed with good reason to be forgeries.

“QUEST. 11. Whether Athanasius was falsely accused, or

did falsely accuse Eusebius of adultery before the Council of Tyre ?”

Athanasius is said to have sent a woman to accuse Eusebius of adultery, in the hope of such a tumult being raised that he might escape being tried. But when Eusebius asked her if she knew the man, she answered that she would not be so senseless as to accuse such men. The friends of Athanasius afterwards inverted this story, as if the woman had been hired by the Eusebians to accuse Athanasius.

“QUEST. 12. Whether Athanasius did sincerely acquit himself of the crime of breaking the communion cup of Inschyras ?”

This question is answered in the negative, and Athanasius’ ingenious artifice to explain away the charge is well exposed.

“QUEST. 13. Whether Athanasius was not made Bishop of Alexandria by sedition and violence against the Canons of that Church ?”

The Bishops who ordained him, after resisting his importunities “for many days together,” and having been kept prisoner in a church by a mob of Athanasius’s party, were obliged to ordain him. He was only twenty-five years of age, so that “the Meletians used to cry, O wickedness ! he a bishop or he a boy ?”

“QUEST. 14. Whether Athanasius was not justly deposed by the Council of Tyre ?”

The justice of the sentence is proved by seven different arguments.

“QUEST. 15. Whether Athanasius was not seditious ?”

This question is answered in the affirmative by an examination of his “Epistle to the Orthodox of all Regions,” and a letter entitled “The People of Alexandria to the Catholic Church, which is under Athanasius the most reverend Bishop.”

“QUEST. 16. Whether Constantius persecuted the Athanasians for religion, or only punished them for immorality ?”

In answering this question Sir Isaac shows that Constantius and his Bishops, in place of persecuting the Athanasians, treated

them with the greatest moderation, and that their martyrs “perished by the sword in resisting the higher powers.” He shows that Hilary, who courted martyrdom by insulting Constantius, and was thus guilty of the capital crime of *Laesa Majestas*, was released from banishment by the Emperor, and allowed to return to his own country. After quoting the favourable opinions of the Emperor given by his enemies, he concludes with the following character of him :—“In short, the virtues of this Emperor were so illustrious, that I do not find a better character given of any Prince for clemency, temperance, chastity, contempt of popular fame, affection to Christianity, justice, prudence, princely carriage, and good government, than is given to him even by his very enemies. He kept up the imperial dignity of his person to the height, and yet reigned in the hearts of his people, and swayed the world by their love to him, so that no Prince could be farther from deserving the name of a persecutor.”

Among the other theological manuscripts of Sir Isaac, there are none so distinctly written as the *Paradoxical Questions*; but there are so many copies of some of them, that it can scarcely be doubted that they were thus repeatedly corrected for publication. The fact, indeed, of Sir Isaac having, previous to his death, burned many of his letters and papers, and left these theological writings behind him, makes it more than probable that he had no desire to suppress his opinions.

The most remarkable of these MSS. is one entitled *Irenicum, or Ecclesiastical Polity tending to Peace*.¹ It consists of twenty *Positions*, or *Theses*, in which the doctrines of Christianity, the government of the Church, and its relations to the State, are described in a few brief and intelligible paragraphs. As the production of a great and good man who had studied the Scriptures and the history of the Church without any sectarian predilections, it cannot but be interesting to the Christian student.²

¹ There are four copies of this MS. with the title *Irenicum*, but only one with the full title given in the text.

² See APPENDIX, No. XXVII.

In a paper of a few pages, entitled *A Short Scheme of the True Religion*, in which religion is described as partly fundamental and immutable, and partly circumstantial and mutable, he treats of *Godliness, Atheism, Idolatry*, and *Humanity*, or our duty to man. "Opposite to godliness," he says, "is Atheism in profession, and idolatry in practice. Atheism is so senseless and odious to mankind, that it never had many professors. Can it be by accident that all birds, beasts, and men have their right side and left side alike shaped (except in their bowels), and just two eyes, and no more, on either side of the face; and just two ears on either side the head, and a nose with two holes; and either two fore-legs, or two wings, or two arms on the shoulders, and two legs on the hips, and no more? Whence arises this uniformity in all their outward shapes but from the counsel and contrivance of an Author? Whence is it that the eyes of all sorts of living creatures are transparent to the very bottom, and the only transparent members in the body, having on the outside a hard transparent skin, and within transparent humours, with a crystalline lens in the middle, and a pupil before the lens, all of them so finely shaped and fitted for vision, that no artist can mend them? Did blind chance know that there was light, and what was its refraction, and fit the eyes of all creatures, after the most curious manner, to make use of it? These, and suchlike considerations, always have, and ever will prevail with mankind, to believe that there is a Being who made all things, and has all things in his power, and who is therefore to be feared."

The section on idolatry is concluded with the following summary:—"We are, therefore, to acknowledge one God, infinite, eternal, omnipresent, omniscient, omnipotent, the Creator of all things, most wise, most just, most good, most holy. We must love him, fear him, honour him, trust in him, pray to him, give him thanks, praise him, hallow his name, obey his commandments, and set times apart for his service, as we are directed in the Third and Fourth Commandments, for this is

the love of God that we keep his commandments, and his commandments are not grievous, 1 John v. 3. And these things we must do not to any mediators between him and us, but to him alone, that he may give his angels charge over us, who, being our fellow-servants, are pleased with the worship which we give to their God. And this is the first and the principal part of religion. This always was, and always will be, the religion of all God's people, from the beginning to the end of the world."

In another manuscript, *On our Religion to God, to Christ, and the Church*, he treats more fully of some of the theses in the *Irenicum*, but his doctrinal opinions are more conspicuous in the following twelve articles, which have no title :—

ART. 1. There is one God the Father, ever living, omnipresent, omniscient, almighty, the maker of heaven and earth, and one Mediator between God and man, the man Christ Jesus.

ART. 2. The Father is the invisible God whom no eye hath seen, or can see. All other beings are sometimes visible.

ART. 3. The Father hath life in himself, and hath given the Son to have life in himself.

ART. 4. The Father is omniscient, and hath all knowledge originally in his own breast, and communicates knowledge of future things to Jesus Christ; and none in heaven or earth, or under the earth, is worthy to receive knowledge of future things immediately from the Father but the Lamb. And, therefore, the testimony of Jesus is the spirit of prophecy, and Jesus is the Word or prophet of God.¹

ART. 5. The Father is immovable, no place being capable of becoming emptier or fuller of him than it is by the eternal ne-

¹ In the Catalogue of Newton's MSS. by Dr. Horsley, he mentions a paper "of twelve short paragraphs in English, which seems to have been the beginning of a treatise on the divinity of our Saviour." In the *fourth* paragraph he adds, "The Arian interpretation of the word *Logos*, in St. John's Gospel, is sustained, but the Socinian doctrine is denied." This was probably another copy of the articles given in the text.

cessity of nature. All other beings are movable from place to place.

ART. 6. All the worship (whether of prayer, praise, or thanksgiving) which was due to the Father before the coming of Christ, is still due to him. Christ came not to diminish the worship of his Father.

ART. 7. Prayers are most prevalent when directed to the Father in the name of the Son.

ART. 8. We are to return thanks to the Father alone for creating us, and giving us food and raiment and other blessings of this life, and whatsoever we are to thank him for, or desire that he would do for us, we ask of him immediately in the name of Christ.

ART. 9. We need not pray to Christ to intercede for us. If we pray the Father aright, he will intercede.

ART. 10. It is not necessary to salvation to direct our prayers to any other than the Father in the name of the Son.

ART. 11. To give the name of God to angels or kings, is not against the First Commandment. To give the worship of the God of the Jews to angels or kings, is against it. The meaning of the commandment is, Thou shalt worship no other God but me.

ART. 12. To us there is but one God, the Father, of whom are all things, and one Lord Jesus Christ, by whom are all things, and we by him.—That is, we are to worship the Father alone as God Almighty, and Jesus alone as the Lord, the Messiah, the Great King, the Lamb of God who was slain, and hath redeemed us with his blood, and made us kings and priests.

On the subject of the Trinitarian controversy, I have found a manuscript of fourteen queries, which may throw some light on the opinions of its author, and which I have, therefore, given in the Appendix.¹

Although Sir Isaac, in his observations on the Prophecies of

¹ See APPENDIX, No. XXVIII.

Daniel, has shown how the Church of Rome, as the eleventh horn of the fourth beast, rooted up three of his first horns, the Exarchate of Ravenna, the kingdom of the Lombards, and the dukedom of Rome, and thus rose up as a temporal power, he has not given any account of the steps by which the Bishop of Rome obtained the rank of the Universal Bishop. In a paper of eight queries, containing his views on this subject, he states, that after the death of Constantius in A.D. 341, he began to usurp the universal Bishopric; that the Emperor Constantius abolished Popery in A.D. 361; and that the Emperor Gratian, in 379, restored, by his edict, the universal Bishopric of Rome over all the West.

The tendency of the Church of England to relapse into Romish superstition seems to have shown itself in the time of Newton, and to have induced him to take steps to counteract it. It is probable that he had been requested by influential persons, both in the Church and in the State, to suggest a legislative measure for correcting an evil which at that time was as dangerous to the State as it was hostile to the articles of the Church and the fundamental truths of Christianity. This proceeding must have taken place at the accession of the House of Hanover in 1714, as will appear from the following draught of an Act of Parliament drawn up by Sir Isaac, and in his own handwriting:—

“Whereas of late years, some opinions have been propagated by superstitious men among the Christians of the Church of England, to break all communion and friendship with the Protestant churches abroad, and to return into the communion of the Church of Rome; such as are the opinions, that the Church of Rome is a true church, without allowing her to be a false church in any respect, and that the Protestant churches abroad are false churches, and that they have no baptism, and by consequence are no Christians, and that the Church of England is in danger, meaning, by the succession of the House of Hanover. For preventing the mischiefs which may ensue upon

such dangerous, uncharitable, and unchristian principles, be it enacted,—

“That the following declaration shall be made and subscribed in open court in the Quarter Sessions next after by all persons.

“We, whose names are underwritten, do solemnly, and without all equivocation or mental reservation, acknowledge and declare that we do sincerely believe that the Church of Rome is, in doctrine and worship, a false, uncharitable, and idolatrous church, with whom it is not lawful to communicate; and that the churches of the Lutherans and Calvinists abroad are true churches, with whom we may lawfully communicate, and that their baptism is valid and authentic; and that the Church of England is in no danger by the succession of the House of Hanover in the throne of the kingdom of Great Britain.”

It is interesting to observe the coincidence of the religious views of Sir Isaac Newton with those of John Locke, his illustrious contemporary and friend. Though, like Newton, he lived in communion with the Church of England, “yet it is obvious,” as Lord King says, “from an unpublished reply to a work of Dr. Stillingfleet’s, that he entertained a strong opinion that the exclusive doctrines of the Church of England were very objectionable—that he thought them much too narrow and confined, and that he wished for a much larger and easier comprehension of Protestants.” In a paper dated 1688, and apparently drawn up for the guidance of a religious society when he was in Holland,¹ we find the following noble article, which Newton would have countersigned, and which, without having adopted the peculiar opinions of these distinguished men, we regard as at once the essence and the bulwark of Protestant truth.

“If any one find any doctrinal parts of Scripture difficult to be understood, we recommend him, 1st, The study of the

¹ This paper, entitled *Pacific Christians*, and containing eleven articles, is published in King’s *Life of Locke*, vol. ii. pp. 63-67. Edit. 1830.

Scriptures in humility and singleness of heart. 2*d*, Prayer to the Father of lights to enlighten him. 3*d*, Obedience to what is already revealed to him, remembering that the practice of what we do know is the surest way to more knowledge ; our infallible guide having told us, if any man will do the will of him that sent me [his will], he shall know of the doctrine, John vii. 17. 4*th*, We leave him to the advice and assistance of those whom he thinks best able to instruct him ; no men, or society of men, having any authority to impose their opinions or interpretations on any other, the meanest Christian ; since, in matters of religion, every man must know and believe and give an account for himself."

Interesting as any opinion of Newton's must be, on every subject to which he has directed his transcendent powers, there is one prophetic of the future destiny of man which has a peculiar value, and with which we may appropriately close our notice of his theological writings.¹ Although Sir Isaac believed in a plurality of worlds, he has nowhere given it as his opinion that the worlds beyond our own are to be the residence of the blessed. This opinion, however, resting on Scripture and science, and combining what is revealed with what is demonstrated, he has distinctly developed in the following passage :—

“ God made and governs the world invisibly, and hath commanded us to love and worship him, and no other God ; to honour our parents and masters, and love our neighbours as ourselves ; and to be temperate, just, and peaceable, and to be merciful even to brute beasts. And by the same power by which he gave life at first to every species of animals, he is able to revive the dead, and hath revived Jesus Christ our Redeemer, who hath gone into the heavens to receive a king-

¹ The writer of the Life of Newton in the *Biographia Britannica* mentions an unfinished work entitled *Lexicon Propheticum*, to which was subjoined a Latin dissertation *On the Sacred Cubit of the Jews*, translated and printed in 1737, by Dr. Birch, in vol. ii. of the Miscellaneous Works of Mr. John Greaves. I have not seen any such MS., and it is not mentioned in Dr. Horsley's Catalogue. The paper on the Cubit may be included in “ Latin Papers relating to the Jewish Temple,” noticed by Dr. Horsley.

dom, and prepare a place for us, and is next in dignity to God, and may be worshipped as the Lamb of God, and hath sent the Holy Ghost to comfort us in his absence, and will at length return and reign over us, invisibly to mortals, till he hath raised up and judged all the dead, and then he will give up his kingdom to the Father, and carry the blessed to the place he is now preparing for them, and send the rest to other places suitable to their merits. *For in God's house (which is the universe), are many mansions, and he governs them by agents which can pass through the heavens from one mansion to another. For if all places to which we have access are filled with living creatures, why should all these immense spaces of the heavens above the clouds be incapable of inhabitants ?*"¹

Such is a brief view of the theological manuscripts of Sir Isaac Newton. With the exception of the "Paradoxical Questions concerning Athanasius," none of them were prepared for the press, and there can be no doubt that his representatives, and also Dr. Horsley, exercised a wise discretion in not giving them formally to the world. Had Sir Isaac found leisure to complete the works of which we have but imperfect fragments, they would have displayed his sagacity and varied erudition, and would have exhibited more correctly and fully than the specimens we have given, his opinions on the great questions of Christian doctrine and ecclesiastical polity.

It is scarcely a matter of surprise that sceptical writers should have spoken disrespectfully of the theological writings of a mathematician and philosopher, but it has surprised us that other authors should have regarded the study of the Scriptures as incompatible with scientific research. When Voltaire asserted that Sir Isaac explained the Prophecies in the same manner as those who went before him, he only exhibited his ignorance of what Newton wrote, and of what others had

¹ I have ventured to state and illustrate views similar to these in the last chapter "On the Future of the Universe," of a little volume entitled *More Worlds than One*. 1854.

written ; and when he stated that Newton composed his Commentaries on the Apocalypse to console mankind for the great superiority which he had over them, he showed but the emptiness of the consolation to which scepticism aspires.

We have few examples, indeed, of truly great men pursuing simultaneously their own peculiar studies and the critical examination of the Scriptures. The most illustrious have been the ornaments of our own land, and England may well be proud of having had Napier, and Milton, and Locke, and Newton, for the champions both of its faith and its Protestantism. From the study of the material universe—the revelation of God's wisdom, to the study of his holy word—the revelation of his will, the transition is neither difficult nor startling. From the homes of planetary life to the homes of its future destiny the mind passes with a firm and joyous step, and it is only when scepticism or intellectual pride has obstructed the path, that the pilgrim falters in his journey, or faints by the way.

When a philosopher like Newton first directs his energies to the study of the material universe, no indications of order attract his notice, and no proofs of design call forth his admiration. In the starry firmament he sees no bodies of stupendous magnitude, and no distances of immeasurable span. The two great luminaries appear vastly inferior in magnitude to many objects around him, and the greatest distances in the heavens seem even inferior to those which his own eye can embrace on the surface of the earth. The planets, when observed with care, are seen to have a motion among the fixed stars, and to vary in their magnitude and distances, but these changes appear to follow no law. Sometimes they move to the east, sometimes to the west, passing the meridian sometimes near and sometimes far from the horizon, while at other times they are absolutely stationary in their path. No system, in short, appears, and no general law seems to direct their motions. By the observations and inquiries of astronomers, however, during successive ages, a regular system has been recognised in this chaos of moving

bodies, and the magnitudes, distances, and revolutions of every planet which composes it have been determined with the most extraordinary accuracy. Minds fitted and prepared for this species of inquiry are capable of appreciating the great variety of evidence by which the truths of the planetary system are established ; but thousands of individuals, and many who are highly distinguished in other branches of knowledge, are incapable of understanding such researches, and view with a sceptical eye the great and irrefragable truths of astronomy.

That the sun is stationary in the centre of our system—that the earth moves round the sun, and round its own axis—that the diameter of the earth is 8000 miles, and that of the sun *one hundred and ten* times as great ; that the earth's orbit is 190 millions of miles in breadth ; and that, if this immense space were filled with light, it would appear only like a luminous point at the nearest fixed star—are positions absolutely unintelligible and incredible to all who have not carefully studied the subject. To millions of our species, then, the Great Book of Nature is absolutely sealed, though it is in the power of all to unfold its pages, and to peruse those glowing passages which proclaim the power and wisdom of its Author.

The Book of Revelation exhibits to us the same peculiarities as that of Nature. To the ordinary eye it presents no immediate indications of its divine origin. Events apparently insignificant—supernatural interferences seemingly unnecessary—doctrines almost contradictory—and prophecies nearly unintelligible, occupy its pages. The history of the fall of man—of the introduction of moral and physical evil—the prediction of a Messiah—the advent of our Saviour—his precepts—his miracles—his death—his resurrection—the gift of tongues—and the subsequent propagation of his religion by the unlettered fishermen of Galilee, are each a stumbling-block to the wisdom of this world. The youthful and vigorous mind, when summoned from its early studies to the perusal of the Scriptures, turns from them with disappointment. It recognises in the

sacred page no profound science—no secular wisdom—no disclosures of Nature's secrets—no palpable impress of an Almighty hand. But, though the system of revealed truth which the Scriptures contain is like that of the universe concealed from common observation, yet the labours of centuries have established its divine origin, and developed in all its order and beauty the great plan of human restoration. In the chaos of its incidents, we discover the whole history of our species, whether it is delineated in events that are past, or shadowed forth in those which are to come,—from the creation of man and the origin of evil, to the extinction of his earthly dynasty, and the commencement of his immortal career.

The antiquity and authenticity of the books which compose the sacred canon—the fulfilment of its prophecies—the miraculous propagation of the gospel—have been demonstrated to all who are capable of appreciating the force of historical evidence ; and in the poetical and prose compositions of the inspired authors, we discover a system of doctrine, and a code of morality, traced in characters as distinct and legible as the most unerring truths in the material world.—False systems of religion have indeed been deduced from the sacred record—as false systems of the universe have sprung from the study of the book of nature ; but the very prevalence of a false system proves the existence of one that is true ; and though the two classes of facts necessarily depend on different kinds of evidence, yet we scruple not to say that the Copernican system is not more demonstrably true than the system of theological truth contained in the Bible. If men of high powers, then, are still found, who are insensible to the evidence which has established the system of the universe, need we wonder that there are others who resist the effulgent evidence which sustains the strongholds of our faith ?

If such be the character of Christian truth, we need not be surprised that it was embraced and expounded by such a genius as Sir Isaac Newton. Cherishing its doctrines, and leaning on

its promises, he felt it his duty, as it was his delight, to apply to it that intellectual strength which had successfully surmounted the difficulties of the material universe. The fame which that success procured him he could not but feel to be the breath of popular applause, which administered only to his personal feelings ; but the investigation of the sacred mysteries, while it prepared his own mind for its final destiny, was calculated to promote the spiritual interests of thousands. This noble impulse he did not hesitate to obey, and by thus uniting philosophy with religion, he dissolved the league which genius had formed with scepticism, and added to the cloud of witnesses the brightest name of ancient or of modern times.¹

What wonder then that his devotion swelled
 Responsive to his knowledge ! for could he,
 Whose piercing mental eye diffusive saw
 The finished university of things,
 In all its order, magnitude, and parts,
 Forbear incessant to adore that power
 Who fills, sustains, and actuates the whole ?

THOMSON.

¹ The piety of Newton was so well known and appreciated by his friends, that he was occasionally consulted about their spiritual state. We have already seen, in page 2 of this volume, that an eminent mathematician "thanked God that his soul was extremely quiet, in which Newton had the chief share;" and, in the following letter from Dr. Morland (the brother, we believe, of Sir Samuel), who was elected a Fellow of the Royal Society in 1703, we find him acting the same benevolent part :—

"SIR,—I have done, and will do my best while I live, to follow your advice, to repent and believe. I pray often as I am able, that God would make me sincere and change my heart. Pray write me your opinion whether, upon the whole, I may die with comfort. This can do you no harm—written without your name. God knows I am very low and uneasy, and have but little strength.

"Your most humble servant,

"JOS. MORLAND.

"Pray favour me with one line, because when I parted I had not your last word to me, you being in haste.

"Direct for Dr. MORLAND, in Epsom, Surrey."

CHAPTER XXV.

Sir Isaac's early study of Chemistry—And of Alchemy, as shown in his letter to Mr. Aston—His Experiments on the Metal for Reflecting Telescopes—His chemical pursuits between 1683 and 1687—His Researches on the Quantities and Degrees of Heat, written after his illness in 1693—His Experiments on the Rarefaction of Air, Water, and Lintseed Oil—His paper on the nature of Acids—The results of his Chemical Researches, published among his queries in his Optics—His opinion on Fire and Flame—On Elective Attractions—Manuscript works on Alchemy left among Sir Isaac's papers—A belief in Alchemy prevalent in Newton's time—Boyle, Locke, and Newton studied Alchemy as a science—Others for fraudulent purposes.

ALTHOUGH Sir Isaac had directed his attention to chemistry at various periods of his life, yet his name has not been associated with any striking discovery in the science. I have therefore reserved an account of such of his chemical researches as have any real value, for the same chapter in which it is necessary to speak of his labours as an alchemist. It was doubtless during his residence with Mr. Clark, the apothecary at Grantham, that he first witnessed, and acquired a taste for, the practical operations of chemistry. In his earliest note-books there are copious extracts from Boyle and other chemical writers, and in 1669, when he wrote his interesting letter to Francis Aston,¹ we see very distinctly the great interest he felt in chemistry, and the peculiar bent of his mind to a belief in the doctrines of alchemy. He requests his young friend to observe the extraction of metals out of their ores, and the processes for refining them, and to notice as “the most luciferous, and many times luciferous experiments in philosophy,” “any transmutations out of their own species into another—of iron

¹ See Vol. I. APPENDIX No. I. pp. 365, 366.

into copper, and any metal into quicksilver, or of one salt into another, or into an insipid body, &c." He returns to the same topic as he proceeds, and asks him to inquire if at the gold, copper, and iron mines at Schemnitz they change iron into copper by a particular process which he describes as done in Italy and other places. He refers also to a method used in various places in Germany of obtaining gold from its solution in the water and rivers by laying mercury in the stream, and straining the mercury through leather so as to leave the gold behind. He concludes this remarkable letter by asking his friend to inquire when in Holland about one Borry, who always went clothed in green, and who had escaped from prison, into which he had been thrown by the Pope, in order to "extort secrets of great worth both as to medicine and profit."

At the time when this letter was written, Newton was occupied with the construction of his reflecting telescope, and he was therefore led to institute new experiments on the alloys of metals, and the changes which they underwent by their union with other bodies. In his letter to Oldenburg in 1671-2,¹ he has mentioned the general results of these experiments, which to a great extent have been the guide of all who have followed him in the construction of metallic specula for reflecting telescopes. He has left behind him, however, a full account of the composition of his specula, and of the method of founding them, in a paper carefully written in his own hand, and entitled *De Metallo ad conficiendum speculum componendo et fundendo*.²

During the four years, from 1683 to 1687, the period in which the *Principia* was composed, he never abandoned his chemical experiments. Dr. H. Newton, who was his amanuensis during that time, tells us that during six weeks in spring and autumn he was so constantly occupied in his laboratory

¹ Jan. 18th and 19th, 1671-2, *Newtoni Opera*, tom. iv. pp. 273, 274. I find records of experiments in Dec. 10-19, 1678, and also in 1679, 1680.

² See APPENDIX, No. XXIX.

that he was scarcely out of it either night or day—that the fire in it was almost always burning—that it was well furnished with chemical materials and apparatus, and that the transmuting of metals was his chief design.

At a later period, in 1692, he was engaged in chemical experiments, as appears from his correspondence with Locke;¹ and at the very time² at which Biot places the mental illness of Newton, I find a carefully drawn up record of chemical experiments made in that very month on the properties and action of barm, and on the distillation of the salts of metals.³ They were resumed in April 1695, and continued to February 1696, when he was called to London upon his appointment to the Wardenship of the Mint.

The only chemical paper of importance published by Sir Isaac, was read at the Royal Society on the 28th of May 1701, and printed in the *Philosophical Transactions*⁴ without his name, under the title of *Scala graduum Caloris*. The following are the principal points of the Scale:—

Degrees of Heat.	Equal parts of Heat.
0	0 Heat of the winter air when water begins to freeze.
1	12 The greatest heat at the surface of the human body, and that at which eggs are hatched.
2	24 Heat of melting wax.
3	48 The lowest heat at which equal parts of tin and bismuth melt.
4	96 The lowest heat at which lead melts.
5	192 The heat of a small coal fire not urged by bellows. The heat of a wood fire is from 200 to 210.

In the original table eleven intermediate points of the scale are accurately determined, and the temperature of other parts of the scale less accurately indicated.

The first column of this table contains the degrees of heat in arithmetical progression; and the second contains the degrees

¹ See pages 76 and 77 of this volume.

² Between the 10th and 30th December 1692. See *Journal des Savans*, 1832, p. 332.

³ Entitled "Experiments and Observations, Dec. 1692, April and June 1693."

⁴ *Phil. Trans.* for March and April 1701. p. 824.

of heat in geometrical progression, the second degree being twice as great as the first, and so on. It is obvious from this table, that the heat at which equal parts of tin and bismuth melt is *four* times greater than that of blood heat; the heat of melting lead *eight* times greater; and the heat of a small coal fire *sixteen* times greater.

This table was constructed by the help of a thermometer and of red-hot iron. By the former he measured all heats as far as that of melting tin; and by the latter he measured all the higher heats. The heat which heated iron loses in a given time is as the total heat of the iron; and, therefore, if the times of cooling are taken equal, the heats will be in a geometrical progression, and may therefore be easily found by a table of logarithms.

He found by a thermometer constructed with lintseed oil, that if the oil, when the thermometer was placed in melting snow, occupied a space of 10,000 parts, the same oil, rarefied with *one* degree of heat, or that of the human body, occupied a space of 10,256; in the heat of water beginning to boil, a space of 10,705; in the heat of water boiling violently, 10,725; in the heat of melted tin beginning to cool, and putting on the consistency of an amalgam, 11,516, and when the tin had become solid, 11,496. Hence the oil was rarefied in the ratio of 40 to 39 by the heat of the human body; of 15 to 14 by the heat of boiling water; of 15 to 13 in the heat of melting tin beginning to solidify; and of 23 to 20 in the same tin when solid. The rarefaction of air was, with the same heat, *ten* times greater than that of oil; and the rarefaction of oil *fifteen* times greater than that of spirits of wine. By making the heats of oil proportional to its rarefaction, and by calling the heat of the human body 12 parts, we obtain the heat of water beginning to boil, 33; of water boiling violently, 34; of melted tin beginning to solidify, 72; and of the same become solid, 70.

Sir Isaac then heated a sufficiently thick piece of iron till it

was red-hot; and having fixed it in a cold place, where the wind blew uniformly, he put upon it particles of different metals and other fusible bodies, and noted the times of cooling, till all the particles having lost their fluidity grew cold, and the heat of the iron was equal to that of the human body. Then, by assuming that the excesses of the heats of the iron and of the solidified particles of metal, above the heat of the atmosphere, were in geometrical progression when the times were in arithmetical progression, all the heats were obtained. The iron was placed in a current of air, in order that the air heated by the iron might always be carried away by the wind, and that cold air might replace it with a uniform motion; for thus equal parts of the air were heated in equal times, and received a heat proportional to that of the iron. But the heats thus found had the same ratio to one another with the heats found by the thermometer; and hence he was right in assuming that the rarefactions of the oil were proportional to its heats.

In giving a notice of this paper, M. Biot justly observes, that it contains three important discoveries, one of which is the method of making thermometers comparable by determining the extreme terms of their graduation from the phenomena of constant temperature; the second is the determination of the law of cooling in solid bodies at moderate temperatures; and the third is the observation of the constancy of temperature in the phenomena of fusion and ebullition—a constancy which has become one of the foundations of the theory of heat. This capital fact is established by numerous and varied experiments made not only upon compound bodies, and upon simple metals, but also upon various metallic alloys, which shows that Newton had felt the importance of it. “We may believe,” M. Biot adds, “with great probability, that this work was one of those which he had finished before the fire in his laboratory.”¹

¹ This constant recurrence to the fatal attack of 1693, which is synonymous with the fire in the laboratory, in order to fix the date of Newton's writings and discoveries, is equally painful and unjust. The date of the fire itself is actually unknown.

This method of determining the date of important discoveries is certainly new in the history of science. Newton himself communicated this paper to the Royal Society in 1701, and, having no other evidence to guide us, we might have reasonably supposed that the experiments on which it was founded, and the important deductions which they authorized, were made a short time previous to its communication. M. Biot, however, follows a different rule. "The paper," he says, "contains three important discoveries, and therefore they must have been made previous to 1692-3," because, after the mental calamity which he believes befell him at that date, he was fit to write nothing but theology! Having already shown that, in every case in which he has thus reasoned, M. Biot has been incorrect in his decision, I was desirous of ascertaining the probable date of these experiments by an examination of Newton's notebooks. In one of the oldest of these I found the following paragraphs written in a fresher ink, and in the handwriting of his later years:—

"The sealed thermometer, or another wholly like it, but made with oil, with the heat of my body (to which I equal that of a bird hatching her eggs), stands at the degree of $17\frac{3}{4}$. —*March 10, 1692* $\frac{2}{3}$. When water begins to freeze, it stands at the degree; when water begins to boil, at the degree; when water boils vehemently, at the degree; when water is as hot as the hand can endure to stay long in, at the degree; when tin begins to melt, at the degree; when wax begins to melt, at the degree; when molten tin sets, at the degree; when molten lead sets, at the degree; when melted wax sets, at the degree

"By dipping a bolt-head with a short neck into hot water, and holding it with its neck under water for six or eight minutes till the glass be as hot as the water—then stopping the glass with my finger, inverting it into a vessel of cold water, taking away my finger, letting it stand for an hour to cool; putting my hand into the cold water and stopping it again

with my finger, when the . . . water within and without the glass, taking it out and weighing the water drawn up into the glass, and the water which will fill the glass, and making allowance for the ascent and descent of the barometer, I found how much the air was rarefied by the heat of the water ; and by a barometer of lintseed oil, I found also how much the oil was rarefied by the same heat. The experiment I made twice, and found the first time that the rarefaction of air was to the rarefaction of water at equal heats as $10\frac{1}{9}$ to 1—the second time as $9\frac{1}{5}$ to 1. 'Tis, therefore, in round numbers, as 10 to 1. By another way of reckoning, I found that the rarefaction of this oil was to the rarefaction of spirit of wine in equal heats, as 15 to 1, or thereabouts, for I did not measure this proportion accurately. From these the rarefaction of air was to that of \forall in equal heats as 150 to 1.

“The space which lintseed oil took up with such heat as I could give to a little bolt-head with my body, was to the space which it took up in such a degree of coldness as made water begin to freeze, as 41 to 40 ; and, therefore, the spaces which air took up in the same degrees of heat and cold, were as 50 to 40, or 5 to 4.”

From this manuscript it is obvious that Newton was engaged in his experiments on the scale of heat at the very time that he was supposed incapable of such an effort ; and as he had not then completed the inquiry, it follows that the discoveries which it contains were made at a later date. The historian of science has not a more painful duty to discharge than that of fixing the date of discoveries, but it is a duty which he is never called to perform unless there are conflicting claims submitted to his judgment. It is a singular obligation which a biographer imposes upon himself to fix the date of a discovery by the alleged insanity of its author.

The only other chemical paper of Sir Isaac's that has been published, is one of about two pages, entitled *De Natura Acidorum*. It is followed by other two pages, entitled *Cogitationes*

Variae, containing a number of brief opinions on chemical subjects, which have been more distinctly and fully reproduced in the Queries at the end of his Treatise on Optics. This paper must have been written subsequently to 1687, as it contains a reference to the *Principia*.

In the note-books and loose manuscripts of Sir Isaac, many chemical experiments and observations are recorded, but it is sometimes difficult to distinguish what is his own from what he has copied from other writers. As he seems to have considered his paper on the scale of heat the only one fit for publication, it is probable that he collected from his note-books the most important of the results at which he had arrived, and published them among the queries in his *Optics*.

The most interesting of these chemical queries relate to fire, flame, vapour, heat, and elective attractions,¹ and as they were revised in 1716 and 1717, we may regard them as containing the most mature opinions of their author. He considers fire as a body heated so hot as to emit light copiously, red-hot iron being nothing else than fire, and a burning coal red-hot wood. In one of his note-books "he concludes that flame is nothing but exhalations set on fire, and that *a burning coal and a burning flame differ only in rarity and density*," that is, that flame consists of particles of carbon brought to a white heat—an opinion of Sir Humphry Davy's. "Flame," he adds, "is nothing but a company of burning little coals dispersed about in the air, flame and vapour differing only as bodies red hot, and not red hot, by cold." He considers the "sun and fixed stars as great earths vehemently hot, whose heat is conceived by the greatness of the bodies and the material action and reaction between them and the light which they emit, and whose parts are kept from burning away, not only by their fixity, but also by the vast weight and density of the atmospheres incumbent upon them, and very strongly compressing them, and condensing the vapours and exhalations which arise from them.

¹ These queries are Nos. 6, 7, 8, 9, 10, 11, and 31.

In his long query on elective attractions, he considers the small particles of bodies as acting upon one another at distances so minute as to escape observation. When salt of tartar deliquesces, he supposes that this arises from an attraction between the saline particles and the aqueous particles held in solution in the atmosphere, and to the same attraction he ascribes it that the water will not distil from the salt of tartar without great heat. For the same reason sulphuric acid attracts water powerfully, and parts with it with great difficulty. When this attractive force becomes very powerful, as in the union between sulphuric acid and water, so as to make the particles "coalesce with violence," and rush towards one another with an accelerated motion, heat is produced by the mixture of the two fluids. In like manner, he explains the production of flame from the mixture of cold fluids,—the action of fulminating powders,—the combination of iron filings with sulphur,—and all the other chemical phenomena of precipitation, combination, solution, and crystallization, and the mechanical phenomena of cohesion and capillary attraction. He ascribes hot springs, volcanoes, fire-damps, mineral coruscations, earthquakes, hot suffocating exhalations, hurricanes, lightning, thunder, fiery meteors, subterraneous explosions, land-slips, ebullitions of the sea, and water-spouts, to sulphureous steams abounding in the bowels of the earth, and fermenting with minerals, or escaping into the atmosphere, where they ferment with acid vapours fitted to promote fermentation.

In explaining the structure of solid bodies, he is of opinion "that the smallest particles of matter may cohere by the strongest attractions, and compose bigger particles of weaker virtue; and many of these may cohere and compose bigger particles whose virtue is still weaker; and so on for divers successions, until the progression end in the biggest particles, on which the operations in chemistry, and the colours of natural bodies, depend, and which, by adhering, compose bodies of a sensible magnitude. If the body is compact, and bends or yields inward to pression, without any sliding of its parts, it

is hard and elastic, returning to its figure with a force arising from the mutual attraction of its parts. If the parts slide upon one another, the body is malleable or soft. If they slip easily, and are of a fit size to be agitated by heat, and the heat is big enough to keep them in agitation, the body is fluid ; and if it be apt to stick to things, it is humid ; and the drops of every fluid affect a round figure, by the mutual attraction of their parts, as the globe of the earth and sea affects a round figure, by the mutual attraction of its parts by gravity.”

Sir Isaac then supposes, that, as the attractive force of bodies can reach but to a small distance from them, “a repulsive virtue ought to succeed ;” and he considers such a virtue as following from the reflexion and inflexions of the rays of light, the rays being repelled by bodies in both these cases without the immediate contact of the reflecting or inflecting body, and also from the emission of light, the ray, as soon as it is shaken off from a shining body by the vibrating motion of the parts of the body, getting beyond the reach of attraction, and being driven away with exceeding great velocity by the force of reflexion, the force that turns it back in reflexion being sufficient to emit it.

We have already seen that Newton at one period of his life was a believer in alchemy, and that he even devoted much time to the study and practice of its processes. The Rev. Mr. Law¹ has stated that there were found among Sir Isaac's papers large extracts out of Jacob Behmen's works, written with his own hand, and that he had learned from undoubted authority, that in a former part of his life he was led into a search of the philosopher's tincture from the same author. He afterwards stated

¹ In his *Appeal to all that doubt or disbelieve the truths of the Gospel*, 3d edit. p. 314, Mr. Law had stated that Sir Isaac Newton borrowed his doctrine of attraction from Behmen's *Teutonic Theosopher*. A correspondent having expressed a desire to know “the foundation which Mr. Law had for such an assertion,” a friend of Mr. Law's replied to this application, and quoted from a letter of Mr. Law's to himself the statement which we have given in the text. The correspondent, in a subsequent communication, expresses his disbelief that Sir Isaac could have betrayed such weakness. See *Gentleman's Magazine*, 1782, vol. lii. pp. 227, 329, and 575.

in a private letter, that his vouchers are names well known, and that they have assured him that "Sir Isaac was formerly so deep in Jacob Behmen, that he, together with Dr. Newton his relative, set up furnaces, and were for several months at work in quest of the tincture." That this statement is substantially true is proved by Dr. Newton's own letter.¹ We have seen in Sir Isaac's handwriting, *The Metamorphoses of the Planets*, by John De Monte Snyders, in 62 pages 4to, and a key to the same work, and numerous pages of alchemist poetry from Norton's *Ordinal*, and Basil Valentine's *Mystery of the Microcosm*. There is also a copy of *Secrets Revealed, or an open entrance to the Shut Palace of the King*,² which is covered with notes in Sir Isaac's hand, in which great changes are made upon the language and meaning of the thirty-five chapters of which it consists. I have found also among Sir Isaac's papers, a beautifully written, but incomplete copy of William Yworth's *Processus Mysterii magni Philosophicus*, and also a small manuscript in his handwriting, entitled *Thesaurus Thesaurorum sive Medicina Aurea*.³

There is no problem of more difficult solution than that which relates to the belief in alchemy, and to the practice of its arts, by men of high character and lofty attainments. When we consider that a gas, a fluid, and a solid may consist of the very same ingredients in different proportions; that the same elements, with one or more atoms of water, form different substances; that a virulent poison may differ from the most wholesome food only in the difference of quantity of the very same ingredients; that gold and silver, and indeed all the metals, may be extracted from transparent crystals, which

¹ See page 55 of this volume.

² By W. C., Lond. 1669, 8vo. "Composed by a most famous Englishman, styling himself *Anonymous* or *Euræneus Philaletha*, who, by inspiration and reading, attained to the philosopher's stone at his age of twenty-three years. Anno Domini, 1645."

³ In addition to these works, Sir Isaac has left behind him, in his Note-books, and separate MSS., copious extracts from the writings of the alchemists of all ages, and a very large *Index Chemicus* and *Supplementum Indicis Chemicæ*, with minute references to the different subjects to which they relate.

scarcely differ in their appearance from a piece of common salt, or a bit of sugar-candy;—that *Aluminum*, a metal with almost all the valuable properties of gold and platinum, can be extracted from clay;—that lights of the most dazzling colours can be obtained from the combustion of colourless salts; that gas, giving the most brilliant light, resides in a lump of coal or a block of wood; that several of the gems can be crystallized from their elements; and that diamond is nothing more than charcoal,—we need not wonder that the most extravagant expectations were entertained of procuring from the basest materials the precious metals and the noblest gems. In the daily experiments of the alchemist, his aspirations, after great discoveries, must often have been encouraged by the singular phenomena which he encountered, and the startling results at which he arrived. The most ignorant compounder of simples could hardly fail to witness the almost magical transformations of chemical bodies, and every new product which he obtained must have added to the probability that the tempting doublet of gold and silver would be thrown from the dice-box with which he gambled. When any of the precious metals were actually obtained from the ores of lead and other minerals, it was not unreasonable to suppose that they had been formed during the process, and men not disposed to speculate might have thus embarked in new adventures to procure a more copious supply, without any insult being offered to sober reason, or any injury inflicted on sound morality.

Nor were the expectations of the alchemists to find a universal medicine altogether irrational and useless. The success of the Arabian physicians in the use of mercurial preparations naturally led to the belief that other medicines, still more general in their application, and more efficacious in their healing powers, might yet be brought to light, and we have no doubt that many important discoveries were the result of such overstrained expectations; but when the alchemists pretended to have obtained such a medicine, and to have conferred longevity

by administering it, they did equal violence to reason and to truth.

When a mind ardent and ambitious is fascinated by some lofty pursuit where gold is the object, and fame the impulse, it is difficult to pause even after successive failures, and to make a voluntary shipwreck of the reputation which has been staked. Hope still cheers the aspirant from failure to failure, till the loss of fortune and the decay of credit disturb the serenity of his mind, and hurry him on to the last resource of baffled ingenuity and disappointed ambition. The philosopher thus becomes an impostor, and, by the pretended transmutation of the baser metals into gold, or the discovery of the philosopher's stone, or of the universal medicine, he attempts to sustain his sinking reputation, and recover the character he has lost. The communication of the great mystery is now the staple commodity with which he is to barter. It can be imparted only to a chosen few—to those among the opulent who merit it by their virtues, and can acquire it by their diligence, and the divine vengeance is threatened against its disclosure. A process thus commencing in fraud and terminating in mysticism, is conveyed to the wealthy aspirant, or to the young enthusiast, and the grand mystery passes current for a season, till some wary professor of the art denounces its publication as detrimental to society.

The alchemy of Boyle, Newton, and Locke cannot be thus characterized. The ambition neither of wealth nor of praise prompted their studies, and we may safely say that a love of truth alone, a desire to make new discoveries in chemistry, and a wish to test the extraordinary pretensions of their predecessors and their contemporaries, were the only motives by which they were actuated. In so far as Newton's inquiries were limited to the transmutation and multiplication of metals, and even to the discovery of the universal tincture, we may find some apology for his researches; but we cannot understand how a mind of such power, and so nobly occupied with

the abstractions of geometry, and the study of the material world, could stoop to be even the copyist of the most contemptible alchemical poetry, and the annotator of a work, the obvious production of a fool and a knave. Such, however, was the taste of the century in which Newton lived, and, when we denounce the mental epidemics of a past age, we may find some palliation of them in those of our own times.

Lady Mary Wortley Montague informs us,¹ that “at Vienna there was a prodigious number of alchemists. The philosopher’s stone,” she says, “is the great object of zeal and science ; and those who have more reading and capacity than the vulgar, have transported their superstition (shall I call it ?) or fanaticism from religion to chemistry ; and they believe in a new kind of transubstantiation, which is designed to make the laity as rich as the other kind has made the priesthood. This pestilential passion has already ruined several great houses. There is scarcely a man of opulence or fashion that has not an alchemist in his service ; and even the Emperor is supposed to be no enemy to this folly in secret, though he has pretended to discourage it in public.”

In these times, and even earlier, Sir Isaac Newton lived. Leibnitz, his great rival, was also an alchemist. In his early life he was secretary to the Society of Rosicrucians at Nuremberg—a secret association which practised alchemy, and which existed in several of the larger towns in Germany. Leibnitz, however, soon renounced his faith in the mystic art, and, there is reason to believe, from one of Newton’s letters to Locke,²

¹ In a letter dated January 2, 1717, and supposed to be written to the Abbé Conti.—*Letters and Works*, vol. ii. p. 130. See p. 229 of this volume.

² See page 76. When Locke, as one of the executors of Boyle, was about to publish some of his works, Newton wished him to insert the second and third part of one of Boyle’s recipes (the first part of which was to obtain “a mercury that would grow hot with gold”), and which Boyle had communicated to him on condition that they should be published after his death. In making this request, Newton “desired that it might not be known that they came through his hands.” And he adds, “One of them seems to be a considerable experiment, and may prove of good use in medicine in analysing bodies. The other is only a knack. In dissuading you from too hasty a trial of this recipe, I have forborne

that he also had learned to have but little confidence even in the humbler department of the multiplication of metals.

to say anything against multiplication in general, because you seem persuaded of it, though there is one argument against it which I could never find an answer to, and which, if you will let me have your opinion about it, I will send you in my next." Letter to Locke, August 2, 1692.—King's *Life of Locke*, vol. i. pp. 410, 413.

Even at the beginning of the present century, some distinguished individuals thought favourably of alchemy. Professor Robison, in writing to James Watt, says, "The analysis of alkalis and alkaline earths will presently lead, I think, to the doctrine of a reciprocal convertibility of all things into all. . . . I expect to see alchymy revive, and be as universally studied as ever." Feb. 11, 1800.—Muirhead's *Origin and Progress of the Mechanical Inventions of James Watt*, vol. ii. pp. 271, 272. Lond. 1854.

CHAPTER XXVI.

Newton's first attack of ill health, and his recovery—History of his acquaintance with Dr. Pemberton, who superintends the third edition of the Principia—Their Correspondence—Improvements in the third edition—Change in the celebrated Scholium—And in the Scholium on the Motion of the Moon's Nodes—Demonstration of Machin and Pemberton—Publication of the third edition—Newton attacked with the Stone—Conduitt acts for him in the Mint—His Letter recommending Colin Maclaurin as Assistant to Gregory—His liberality on this occasion—Maclaurin's Letter to Newton—Visit of the Abbé Alari to Newton—His acquaintance with Samuel Crell—He presides at the Royal Society on the 2d March—His last illness—And Death on the 20th March 1727—His body lies in state—His Burial and Monument in Westminster Abbey—Statues and Pictures of him—His Property—His Descendants.

ALTHOUGH Sir Isaac had now attained to a very advanced age, he had for a long time enjoyed almost uninterrupted health. In 1722, however, when he had entered his eightieth year, he was seized with incontinence of urine, which, though at first ascribed to stone, and thought incurable, was owing merely to a weakness in the sphincter of the bladder. Dr. Mead advised him to give up the use of his carriage, neither to dine abroad, nor with large parties at home, and to limit his diet to a little butcher-meat and broth, vegetables, and fruit, of which he was always very fond. By these means he recovered slowly, though never perfectly, as the disease was always brought on by motion of any kind. In July 1722, when he was corresponding with Varignon, who died in that year, he wrote to him that he was getting slowly well, and hoped soon to enjoy his usual health;¹ but there is reason to believe that the seeds of a more painful disease, of which this was only the herald, were lurking in his constitution, and would sooner or later come to maturity.

Thus warned of his slight tenure of life, he resolved to pro-

¹ "Paulatim convalesco, et spero me salutem cito fruturum."

ceed with the third edition of the *Principia*, for which he had been long making preparation. The premature death of Mr. Cotes had deprived him of his valuable assistance, but he had the good fortune to obtain the services of Dr. Henry Pemberton, a young and accomplished physician, who had successfully cultivated mathematical learning, and who, from various causes, was particularly qualified for the task of editing so great a work. When Pemberton was studying medicine at Leyden under Boerhaave, a gentleman lent him the *Principia*, which was then extremely scarce. Having heard that it was a work of difficult comprehension, he was surprised at his own facility in mastering its problems, and in order to pursue the subject, he devoted himself to the study of the doctrine of fluxions, and of prime and ultimate ratios, as explained in the introduction to Newton's treatise, *De Quadratura Curvarum*. Soon after this he solved the problem with which Leibnitz had challenged the English mathematicians; and upon showing his solution to Dr. Keill, he was so pleased with the talent which it displayed, that he immediately introduced him to Sir Isaac.¹ Owing, as Dr. Wilson informs us, to "some ill offices done by a malevolent person who then had Sir Isaac's ear," the great philosopher paid no attention to the young geometer, to whom he was hereafter to owe so many obligations. Pemberton was mortified with the cold reception he had experienced; but having the most ardent desire to become acquainted with so great a philosopher, he thought he would best accomplish his object by writing a Treatise, containing a popular account of Sir Isaac's discoveries. An unforeseen accident, however, gained for him his object by a less dilatory process. Signior Poleni, an Italian mathematician, had published in his tract *De Castellis*, an experiment which he considered as proving Leibnitz's assertion that the force of descending bodies is proportional to the square of the velocity, and not, as is commonly thought, to the simple velocity. Dr. Pemberton saw its insufficiency, and drew

¹ See this volume, p. 23, and *Macclesfield Correspondence*, vol. ii. p. 424.

up a refutation of it, which he showed to his friend Dr. Mead. The Doctor immediately communicated it to Sir Isaac, who was so well pleased with it, that he called upon Pemberton at his lodgings, and showed him a refutation of Poleni by himself, grounded on other principles.¹ In this agreeable way Pemberton secured the friendship of Newton, and they often met together to converse on mathematical and philosophical subjects. Though Sir Isaac quickly discovered the capacity of his young friend, his modesty was so great, as Wilson informs us, that he solicited Dr. Mead to prevail on Pemberton to assist him in bringing out a new edition of the *Principia*.²

Owing to the smallness of the impression of the second edition of that work, it seems to have been quickly sold, but having been reprinted at Amsterdam in 1713, the foreign demand for it was amply supplied. In Dr. Horsley's list of the MSS. at Hurtsbourne Park, he mentions a copy of "the second edition of the *Principia*, interlined with some written notes of Sir Isaac Newton," which is no doubt the work referred to in the

¹ Pemberton's Paper, in the form of a letter to Dr. Mead, was published in the *Philosophical Transactions* for April and May, 1722, No. 371, p. 57. Sir Isaac's refutation was added in a postscript to the letter without his name, as having been given to the author "by an excellent and learned friend of his, to whom he had been pleased to show the letter, in confirming Sir Isaac Newton's sentiment in relation to the resistance of fluids." As the subject excited much controversy, Sir Isaac's simple and intelligible view of it may be interesting to the reader. "Suppose," says he, "pieces of fine silk, or the like thin substance, extended in parallel planes, and fixed at small distances from each other. Suppose then a globe to strike perpendicularly against the outermost of the silks, and by breaking through them to lose part of its motion. If the pieces of silk be of equal strength, the same degree of force will be required to break each of them, but the time in which each piece of silk resists, will be so much shorter as the globe is swifter; and the loss of motion in the globe consequent upon its breaking through each silk, and surmounting the resistance thereof, will be proportional to the time in which the silk opposes itself to the globe's motion, insomuch that the globe, by the resistance of any one piece of silk, will lose so much of its motion as it is swifter. But, on the other hand, by how much swifter the globe moves, so many more of the silks it will break through in a given space of time; whence the number of the silks which oppose themselves to the motion of the globe in a given time being reciprocally proportional to the effect of each silk upon the globe, the resistance made to the globe by these silks, or the loss of motion the globe undergoes by them in a given time, will be always the same."—Pp. 67, 68.

² Dr. Wilson's *Preface to Pemberton's Course of Chemistry*. Lond. 1771.

memorandum which he left in the library of Christ's Church, Oxford, and which is mentioned by Professor Rigaud.¹ These notes, therefore, must have formed the new matter which was introduced into the third edition by Newton himself, and were probably copied from the volume which contains them, and transmitted to Dr. Pemberton to be inserted in the printed sheets of the second edition.²

The printing of the new edition seems to have commenced either in the very end of 1723, or at the beginning of 1724, and was not finished till the month of February 1726. The letters which passed between Newton and Pemberton during the progress of the work, had they been preserved, would have been interesting in many respects, and have completed the history of the *Principia*. Dr. Pemberton informs us that "he was very frequently with him, and as they lived at some distance, a great number of letters passed between them on that account."³ The letters of Newton, however, have unfortunately been lost, but the greatest part, if not the whole, of those of Pemberton have been preserved.⁴ The date of the earliest of these, which relates to a criticism on the last two lines of the sixty-third page, is February 11, 1723-4, but it was preceded by five letters without dates, so that the printing of the work must have commenced in December 1723, or in January 1724. The Preface bears the date of January 1725-6, but there is a long letter from Pemberton dated February 9, 1725-6, in which he points out the necessity of some changes in the 23d and 24th Propositions of the First Book, and pro-

¹ *Hist. Essay*, p. 106. I did not find this volume among the papers in Hertsbourne Park, when I examined them in 1836. It appears to have been in the hands of Dr. Horsley when he edited the works of Newton.

² See APPENDIX, No. XXX., in which we have given the principal alterations and additions made in the Third Edition of the *Principia*.

³ *View of Sir Isaac Newton's Philosophy*, Preface, p. 2.

⁴ These letters are twenty-three in number, with seven sheets of Queries, containing suggestions for the improvement of the work. Only seven of the letters have dates. The Rev. Mr. Jeffrey Ekins has kindly sent me a copy of a short one in his possession, but without a date.

poses to cancel two leaves, which together with other two cancels, would require the reprinting of a whole sheet. The letters of Pemberton contain numerous suggestions for the improvement of the work, and with one or two exceptions they seem to have been implicitly adopted by Newton. He never alters a single word without permission, and when the changes which he suggests are of importance, he enters into full explanations of the grounds upon which they are proposed. I am disposed to think that Newton addressed comparatively few letters to Pemberton during the printing of the work. Their correspondence was carried on through the printing-office, and it is probable that Newton wrote his answers principally upon the proof-sheets, accepting or modifying the alterations proposed by his friend. There is only one reference in the letters to a personal interview. On another occasion, Newton leaves a new corollary with Mr. Innys the bookseller, and in none of Pemberton's letters does he acknowledge the receipt of any letter on the subject of Newton's additions or his own suggestions. Sir Isaac was at no period of his life fond of writing letters; and least of all in his old age. He wrote scrolls of almost every letter he composed, and we are persuaded that among Pemberton's papers which have been lost, there were very few of the letters of Newton.

Among the more interesting changes made in the third edition are the changes in the celebrated Scholium on Fluxions, and in the new Scholium on the Motion of the Moon's Nodes in Prop. 33 of the Third Book. Newton, as we have already seen, has been greatly blamed by foreign writers for the omission of the paragraph about Leibnitz, which he had inserted in the two first editions of his work. Montucla¹ has ventured to insinuate that it was left out by Pemberton without Newton's consent; but Dr. Wilson, Pemberton's friend, bears witness that the new Scholium "was entirely composed by Sir Isaac,

¹ *Hist. des Mathématiques*, vol. ii. p. 338. Paris, 1758. See also *ante*, vol. i. p. 353, and APPENDIX to vol. i., No. XII.

and printed from his own handwriting." As no reference whatever is made to it in Pemberton's letters, it is probable that there was no difference of opinion about the propriety of the change, and that Pemberton saw no grounds for proposing any alteration upon the new form which had been given to the Scholium.¹

Between the publication of the second and third edition, Mr. Machin, Professor of Astronomy in Gresham College, communicated a new demonstration of the motion of the moon's nodes. When it was sent to Pemberton for insertion, he informs Newton that he had himself invented a similar demonstration, and had mentioned it in his letter to Dr. Wilson on certain inventions of Cotes.² Sir Isaac, therefore, drew up, in conformity with these facts, the Scholium we have mentioned, and added to it the two propositions of Machin, as they had been first sent to him.

In February or March 1726, the third edition of the *Principia* was published, with a new preface by the author, dated January 12, 1725-26, in which he mentions the more important additions which he had made, and states that Dr. Henry Pemberton,³

¹ See vol. i. pp. 357-362, and APPENDIX to vol. i. No. XII. p. 426.

² *Epistola ad Amicum de Cotesii inventis, curvarum ratione quæ cum Circulo et Hyperbola comparationem admittunt*, pp. 6, 7, 4to. Lond. 1722. This letter is addressed *Amico Suo J. W. Integerrimo Dilectissimoque, H. P. Salutem*. See Dr. Wilson's Preface to Pemberton's *Course of Chemistry*, p. vi., for the history of this interesting volume. The Theorem of Cotes, rather prolixly demonstrated by Pemberton, was attacked with more success by Demoivre, and afterwards demonstrated directly by John Bernoulli. *Opera*, tom. iv. p. 68.

³ Dr. Pemberton was born in London in 1694. He took the degree of medicine at Leyden, and became acquainted with Newton in the way we have already mentioned. Immediately after Sir Isaac's death in 1727, he advertised a Translation of the *Principia*, with a Comment; but the publication of Motte's Translation in 1729 prevented him from proceeding with this work. He devoted himself, however, to the completion of his "View of Sir Isaac Newton's Philosophy," part of which was submitted to Newton before his death. In Dr. Mead's letter to Conduitt, already mentioned, he says, "Dr. Pemberton has also given part of his Book to the Knight, of which he read some part immediately, and kept the papers, and seemed very well pleased. You may depend upon his having the perusal of the whole of it if he will be pleased to take the trouble." Pemberton was chosen Professor of Physic in Gresham College, and gave lectures on chemistry, which were published after his death, by his friend Dr. Wilson. He died in 1771, at the age of 77. See Preface to his *Course of Chemistry*.

“vir harum rerum peritissimus,”¹ superintended the edition.²

Had Sir Isaac enjoyed his usual health, he would no doubt have made greater additions to the *Principia*, but, notwithstanding the precautions which he observed, he experienced a return of his former complaint; and, in August 1724, he passed, without any pain, a stone about the size of a pea, which came away in two pieces, the one at the distance of some days from the other. After some months of tolerably good health, he was seized in January 1725, with a violent cough and inflammation of the lungs, and, in consequence of this attack, he was prevailed upon to take up his residence at Kensington,³ where his health experienced a decided improvement. In February 1725, he was attacked in both his feet with a fit of the gout, of which he had received a slight warning a few years before, and the effect of this new complaint was to produce a beneficial change in his general health. On Sunday the 7th of March, when his head was clearer and his memory stronger than Mr. Conduitt had known it to be for some time, he entered into a long conversation on various topics in astronomy of a speculative nature, which Mr. Conduitt, who knew little of the subject, has, we think, very imperfectly reported.⁴

¹ I have found a copy of the Preface, with the date of November 1725. It is shorter than the one printed, and does not contain the well-merited compliment to Dr. Pemberton, who, as his friend Dr. Wilson tells us, valued it more than the liberal present of 200 guineas which Newton gave him. Pemberton's *Chemistry*, Preface, p. xv.

² Twelve fine paper copies were printed. There is one in the library of Trinity College, one in that of Queen's College, which Newton had presented to J. F. Fauquier, one in the Royal Society library, presented by Martin Folkes in the name of the President, on the 31st March 1726 (Edleston's *Correspondence*, p. lxxix.), and one in the Observatory at Oxford, which Newton had presented to Bradley. Mr. Rigaud says “that they were all originally bound with gilt leaves in red morocco, to a pattern which was much used for the Harleian Library.”—*Memoirs of Bradley*, p. xi. Newton sent six copies of the work to Fontenelle, for the Academy of Sciences, for himself and for the principal mathematicians in Paris.

³ According to Dr. Stukely, he lived at Orbell's Buildings. In Maude's *Wensleydale* he is said to have “died in lodgings in that agreeable part of Kensington called Orbell's now Pitt's Buildings.”

⁴ This paper was published in the Appendix to my former Life of Newton, but as Sir

Although his health was greatly improved, yet his indisposition was sufficiently severe to unfit him for the discharge of his duties at the Mint; and as his old deputy was confined with the dropsy, he was desirous, in the winter of 1725, of resigning in favour of Mr. Conduitt. Difficulties, however, seem to have been experienced in making this arrangement, but all the duties of the office were so satisfactorily performed by Mr. Conduitt, that during the last year of his life Sir Isaac hardly ever went to the Mint.

Among the last duties which he discharged with his pen, and one distinguished, too, by his usual liberality, was that of obtaining for Colin Maclaurin¹ the situation of assistant and successor to Mr. James Gregory, Professor of Mathematics in the University of Edinburgh. Mr. Maclaurin, who then filled the chair of Mathematics in Aberdeen, having applied to Sir Isaac for a testimonial of his qualifications, received the following answer, "with allowance to show it to the patrons of the University:"—"I am very glad to hear that you have a prospect of being joined to Mr. James Gregory in the Professorship of the Mathematics at Edinburgh, not only because you are my friend, but principally because of your abilities, you being acquainted as well with the new improvements of mathematics as with the former state of those sciences. I heartily wish you good success, and shall be very glad of hearing of your being elected.—I am, with all sincerity, your faithful friend and most humble servant."

To this letter Maclaurin returned the following answer:—

"HONOURED SIR,—I am much obliged to you for your kind letter that Mr. Hadley transmitted to me. It has been of use to me. However, the provost or mayor of the town has thought fit to consult yourself directly on that subject, because I made

Isaac has given his opinions on the same subjects more deliberately in his letters to Bentley and elsewhere, I have not thought it advisable to reprint it.

¹ Notice of Maclaurin's Life, prefixed to his *Account of Sir Isaac Newton's Discoveries*, p. iv. Lond. 1748. I have not found a copy of this letter among Newton's papers.

some scruples to make your letter, that was addressed to me, public. I flatter myself you will, as soon as your convenience will allow, give an answer to this letter, that the want of it may not obstruct the affair.

“I have lately had a dispute with a gentleman here, who attacked your Prop. 36, lib. ii. of the *Principia*, and is supposed to be a pretty good mathematician. 'Tis about the pressure upon the circellus PQ (Prop. 36, lib. ii. Cor. 7, 8, 9, 10). He finds by a calcul of his, that the pressure upon PQ is to the cylinder on the base PQ of the height $\frac{1}{2}$ GH, as $2 AB^2$ to $AB^2 + EF^2 = PQ^2$, whereas you make that proportion as $2 EF^2$ to $2 EF^2 - PQ^2$ in Cor. 10.

“I can demonstrate (and he allows it) that when CD and EF are equal, the pressure on PQ is to the cylinder on PQ of the height $\frac{1}{2}$ GH as $2 EF^2$ to $2 EF^2 - PQ^2$. But he objects, that though the proportion must be allowed in that case, yet it cannot be general, and that it ought to vary with AB, though AB does not enter into your proportion. Cor. 10, Prop. 36.

“I have answered this, and have showed, that when AB is very great, the pressure on PQ should be the weight of the whole cylinder above PQ, according to him, because the ratio of $2 AB^2$ to $AB^2 + EF^2 - PQ^2$, in that case is a ratio of $2 AB^2$ to AB^2 , or of 2 to 1. And this I think absurd, since, by the very idea of the cataract, PQ cannot bear the whole cylinder above it.

“But I trouble you no farther. I am more and more satisfied that your book will triumph over all that oppose it; and that as it has met with resistance from the prejudices and humours of men, it will prevail the longer.—I am, with much gratitude, and the greatest respect, honoured Sir, your most obliged, most humble servant,

“COLIN MACLAURIN.

“EDINBURGH, Oct. 25, 1725.”

In consequence of this letter, Sir Isaac returned the following answer to the Lord Provost, of which I have found two

copies slightly different and more complete than the one printed in Maclaurin's Life.

“MY LORD,—I received the honour of your letter, and am glad to understand that Mr. Maclaurin is in good repute amongst you for his skill in mathematics, for I think he deserves it very well. And, to satisfy you that I do not flatter him, and also to encourage him to accept of the place of assisting Mr. Gregory, in order to succeed him, I am ready (if you please to give me leave) to contribute twenty pounds per annum towards a provision for him, till Mr. Gregory's place become void, if I live so long, and I will pay it to his order in London.¹ When your letter arrived at London I was absent from hence, which made it the later before I received it, otherwise I might have returned an answer a little sooner.—I am, my Lord, your Lordship's most humble and most obedient servant,

“ISAAC NEWTON.

“To his Lordship the
PROVOST OF EDINBURGH,
in Scotland.”

It is almost unnecessary to say, that Maclaurin was appointed to the chair in November 1726 ; but it is interesting to notice, that Newton's recommendation of him is engraven, in two words, on the tablet erected in memory of Maclaurin, and fixed upon the south wall of the Greyfriars' Church. When a youth at College, I have often gazed upon this simple monument, and pondered over the words, to be envied by every aspirant to scientific fame,—“NEWTONO SUADENTE.”²

¹ In the first scroll of the letter there was inserted the following passage, “For I have a kindness also for Mr. Gregory upon his brother's account, and should be glad to have a hand in helping him to a coadjutor,” but it was struck out.

On the back of the two scrolls, which are written on the same page, are the following words:—“I reckon him well skilled in arithmetic, algebra, geometry, astronomy, and optics, which are the mathematical sciences proper for a university, and abundantly sufficient for a Professor.”

² Colin Maclaurin was born in February 1698. He studied mathematics under Dr. Robert Simson at Glasgow, and was in 1717 elected Professor of Mathematics in Mari-

Notwithstanding his great age, and his imperfect health, Sir Isaac was able to attend the meeting of the Royal Society, and to receive with hospitality distinguished foreigners who were introduced to him. The Abbé Alari, the instructor of Louis xv., and the friend of Bolingbroke, spent two months in London in 1725. He paid a visit to Newton, of which the following flippant and apparently incorrect account has been given by a friend :—“ He visited the University of Cambridge and the great Newton, who enjoyed, at that time, in the capital of England, the general esteem of Europe, and 50,000 livres of salary as Master of the Mint. The Abbé having gone to his house at nine o'clock in the morning, Newton began by telling him that he was eighty-three years of age. There was in his chamber the portrait of his patron, Lord Halifax, and one of the Abbé Varignon, of whose geometrical writings he had a high opinion. ‘ Varignon,’ he said, ‘ and Father Sebastien, the Carmelite, are those who have understood best my system of colours.’ The conversation at last turned on ancient history, with which Newton was then occupied. The Abbé, who was deeply read in Greek and Latin authors, having made himself very agreeable, was asked to dinner. The repast was detestable. Newton was stingy, and gave his guests wines of Palma and Madeira, which he had received in presents. After dinner

schal College, Aberdeen. In 1719 he became acquainted with Newton, and was elected a Fellow of the Royal Society, to whose *Transactions* he contributed two papers. He gained the prize of the Academy of Sciences for 1724, on the Percussion of Bodies. In 1742, he published his Treatise on Fluxions, which was written in answer to Berkeley's Analyst. In 1745, he took an active part in defending Edinburgh against the approach of Prince Charles; and in superintending the execution of the works which he had designed, he caught the cold, of which he died on the 14th June 1746, in the forty-eighth year of his age. Mr. Conduitt had requested him as a friend to draw up an account of Newton's discoveries for the biography of him, in which he was engaged. Maclaurin sent the MS. of it to London; but in consequence of the death of Conduitt in 1797, the MS. was returned, and it became the foundation of his admirable *Account of Sir Isaac Newton's Philosophical Discoveries*, which was published after his death. Maclaurin was a man, like Newton, of undoubted piety, and an humble Christian. He died while dictating to his amanuensis the last chapter of his work, in which he proves the wisdom, the power, the goodness, and the other attributes of the Deity.

he took the Abbé to the Royal Society, of which he was the President, and made him sit at his right hand. The business began, and Newton fell asleep. When it was over, everybody signed the register, and the Abbé among the rest.¹ Newton took him to his house, and kept him till nine o'clock in the evening."²

In the following year Newton received visits from Samuel Crell,³ a distinguished German divine, who had embraced the opinions of Socinus, and was appointed minister of a Unitarian church on the frontiers of Poland. He came to England in 1726, for the purpose of printing the last of his works, which was published in that year.⁴ After his return to Amsterdam, where he resided during the rest of his life, he sent to his friend Lacroze, the celebrated orientalist, in a letter dated 17th July 1727, the following account of his visits to Newton, whose death a few months before had given a great interest to everything associated with his name:—"I also conversed at different times with the illustrious Newton, who died in the month of March at the age of eighty-five. He read manuscript without spectacles, and without bringing it near his eyes. He still reasoned acutely as he was wont to do, and told me that his memory only had failed him. Gout and the stone occasionally troubled him at his very advanced age. A few weeks before his death he threw into the fire many manuscripts written in his own hand. He left, however, some to be printed, among which is one entitled *Historia Dominationis Clericorum*,

¹ The Abbé signed only the Journal Book.

² *Essais Historique sur Bolingbroke*, compiled by General Grimoard in *Lettres Historiques . . . de . . . Bolingbroke*, vol. i. p. 155, Paris, 1808. Mr. Edleston, from whose work we have copied the anecdote in the text, gives the following "as the simple record in the Journal Book of Alari's visit:" "Mr. Mildmay had leave to be present, as also Mr. Peter Joseph Alari, a French gentleman."—*Correspondence, &c.*, p. lxxxviii.

³ Born 1657, died 1747.

⁴ *Initium Evangelii S. Johannis Apostoli ex antiquitate ecclesiastica restitutum, itidemque nova ratione illustratum*, 8vo, 1726. It was published under the name of *L. M. Artemonius*, because he had adopted the opinions of Artemon, a heretic of the third century, respecting our Saviour. The letters L. M. signify *Lucas Mellerius*, the anagram of *Samuel Crellius*.

as I was assured by his physician, the celebrated Dr. Mead. He was not only deeply versed in mathematics and philosophy, but likewise in theology and ecclesiastical history. He had also written, as he himself told me, a Commentary on the Apocalypse of St. John. Whether or not he burnt it, I did not learn. He expressed a wish to read my book, and he read it when it was printing, because it seemed to contain some things that were new.”¹

Having completed the new edition of his great work, Sir Isaac seems to have abstained from all intellectual labour during the latter half of 1726, with the exception of what is indicated by two letters to the Rev. Mr. Mason,² and his letter to Fontenelle in June or July, accompanying the six copies of the *Principia* for the Academy of Sciences.³ He had received much benefit from absolute rest and from the air of Kensington, but his friends found it very difficult to restrain him from going occasionally to town. In the month of August he complained of an affection of the rectum, which he thought was fistula, but Mr. Cheselden found upon examination that it was “nothing but a little relaxation of the inward coat of the gut;” and this opinion, as Dr. Mead wrote to Mr. Conduitt then in the country, “made his old friend very easy in the matter.”⁴

When thus confined to the house, Sir Isaac amused himself with reading, but as Mr. Conduitt informs us, “the book which was commonly lying before him, and which he read oftenest at last, was a duodecimo Bible.” “I found,” he adds, “his eyes bloodshot one morning, and he complained that something swam before them. When I asked him what he thought had occasioned the disorder, he said he believed that he

¹ *Thesaurus Epistolicus Lacrozianus*, tom. i. p. 105. Edidit J. L. Uhlius, Lipsiæ, 1742-1746, three vols. 4to.

² One dated May 10, 1726, sending £3 for repairing the floor of Colsterworth Church, and the other dated February 4, 1727, on the assay of a piece of ore.

³ I have found a scroll of this letter without a date, and Fontenelle's answer to it, dated July 14, 1726.

⁴ This letter is dated August 11, 1726. Dr. Mead had received two letters of inquiry from Conduitt on the occasion, to which this was the answer.

had overstrained the optic nerves, for the morning or two last past he had waked before the sun was quite up, and had endeavoured to see what o'clock it was on his watch, by a very little light that came through the curtains and the shutter; upon which he left that off, and found out the hour by feeling with his hand, and his eyes soon recovered."

Thinking that he was fit for the journey, he went to London on Tuesday the 28th of February, to preside at a meeting of the Royal Society on the 2d of March, and on the following day Mr. Conduitt thought he had not seen him better for many years. Sir Isaac himself was sensible of the change, and "told his nephew smiling, that he had slept the Sunday before from eleven at night till eight in the morning without waking." These feelings, however, were fallacious. He had undergone great fatigue in going to the Society, and in paying and receiving visits, and the consequence of this was a violent attack of his former complaint. He was taken ill on Friday the 3d March, and continued so after his return to Kensington on Saturday the 4th of March. For a whole week he had no medical advice; but the moment Mr. Conduitt heard of his illness, which was on Saturday the 11th March,¹ he sent for Dr. Mead and Mr. Cheselden, who pronounced the disease to be stone in the bladder, and held out no hopes of his recovery. "The stone had probably been moved from the place where it lay quiet by the great motion and fatigue of his last journey to London." From that time he experienced violent fits of pain with very brief intermissions, and though the drops of sweat ran down his face in these severe paroxysms, he never uttered a cry or a complaint, or displayed the least marks of peevishness or impatience, but during the short intervals of relief "would smile and talk with his usual cheerfulness." On Wednesday the 15th of March he appeared to be somewhat better, and slight though groundless hopes were entertained of

¹ Mr. Conduitt has left three different accounts of his illness. Some of the facts mentioned above are found only in one of them, apparently the one first written.

his recovery. On the morning of Saturday the 18th, he read the newspapers, and carried on a pretty long conversation with Dr. Mead. His senses and his faculties were still vigorous, but at six o'clock of the same evening, he became insensible, and continued in that state during the whole of Sunday and till Monday the 20th, when he expired without pain between one and two o'clock in the morning, in the eighty-fifth year of his age,—

. . . 'Tis done, the measure's full,
And I resign my charge.

THOMSON.¹

His body was removed from Kensington to London, and on Tuesday the 28th March it lay in the Jerusalem Chamber, and was thence conveyed to Westminster Abbey, where it was buried near the entrance into the choir on the left hand. The Pall was supported by the Lord High Chancellor, the Dukes of Montrose and Roxburghe, and the Earls of Pembroke, Sussex, and Macclesfield, who were Fellows of the Royal Society. The Honourable Sir Michael Newton, Knight of the Bath, was chief mourner, and was followed by some other relations, and several eminent persons who were intimately acquainted with the deceased. The office was performed by the Bishop of Rochester, attended by the prebends and choir.²

Sensible of the high honour which they derived from their connexion with so distinguished a philosopher, the relations of Sir Isaac Newton, who inherited his personal estate,³ agreed to devote £500 to the erection of a monument to his memory ; and the Dean and Chapter of Westminster appropriated for it a place in the most conspicuous part of the Abbey, which had often been refused to the greatest of our nobility. This monu-

¹ A poem sacred to the Memory of Sir Isaac Newton.

² The *London Gazette*, April 4, 1727. No. 6569.

³ These were the three children of his half-brother Smith, the three children of his half-sister Pilkington, and the two daughters of his half-sister Barton, all of whom survived Sir Isaac. *New Anecdotes of Sir Isaac Newton*, by J. H., a Gentleman of his Mother's Family. See *Annual Register*, 1776, vol. xix. p. 25 of Characters. The author of this paper was James Hutton, Esq. of Pimlico. See APPENDIX, No. XXXI.

ment was erected in 1731. On the front of a sarcophagus resting on a pedestal, are sculptured in basso relievo youths bearing in their hands the emblems of Sir Isaac's principal discoveries. One carries a prism, another a reflecting telescope, a third is weighing the sun and planets with a steelyard, a fourth is employed about a furnace, and two others are loaded with money newly coined. On the sarcophagus is placed the figure of Sir Isaac in a cumbent posture, with his elbow resting on several of his works. Two youths stand before him with a scroll, on which is drawn a remarkable diagram relative to the solar system, and above that is a converging series. Behind the sarcophagus is a pyramid, from the middle of which rises a globe in mezzo relievo, upon which several of the constellations are drawn, in order to show the path of the comet in 1681, whose period Sir Isaac had determined, and also the position of the solstitial colure mentioned by Hipparchus, and by means of which Sir Isaac had, in his Chronology, fixed the time of the Argonautic expedition. A figure of Astronomy as Queen of the Sciences sits weeping on the Globe with a sceptre in her hand, and a star surmounts the summit of the pyramid. The following epitaph is inscribed on the Monument :—

Hic situs est
 Isaacus Newton, Eques Auratus,
 Qui animi vi prope divina,
 Planetarum Motus, Figuras,
 Cometarum semitas, Oceanique Æstus,
 Sua Mathesi facem preferente,
 Primus demonstravit.
 Radiorum Lucis dissimilitudines,
 Colorumque inde nascentium proprietates.
 Quas nemo antea vel suspicatus erat, pervestigavit.
 Naturæ, Antiquitatis, S. Scripturæ,
 Sedulus, sagax, fidus Interpres,
 Dei Opt. Max. Majestatem philosophia asseruit,
 Evangelii simplicitatem moribus expressit.
 Sibi gratulentur Mortales, tale tantumque extitisse
 HUMANI GENERIS DECUS.
 Natus xxv. Decemb. MDCXLII. Obiit xx. Mar.
 MDCCLXXVII.

Of which the following is a literal translation :—

Here Lies
 Sir Isaac Newton, Knight,
 Who, by a vigour of mind almost supernatural,
 First demonstrated
 The motions and Figures of the Planets,
 The Paths of the Comets, and the Tides of the Ocean.
 He diligently investigated
 The different refrangibilities of the Rays of Light,
 And the properties of the Colours to which they give rise.
 An Assiduous, Sagacious, and Faithful Interpreter
 of Nature, Antiquity, and the Holy Scriptures,
 He asserted in his Philosophy the Majesty of God,
 And exhibited in his Conduct the simplicity of the Gospel.
 Let Mortals rejoice
 That there has existed such and so great
 AN ORNAMENT OF THE HUMAN RACE.
 Born 25th Dec. 1642, Died 20th March 1727.

In the beginning of 1731, a medal was struck at the Tower in honour of Sir Isaac Newton. It had on one side the head of the philosopher, with the motto, *Felix cognoscere causas*, and on the reverse a figure representing the mathematics.

On the 4th July 1755, a magnificent full-length statue of Sir Isaac Newton, in white marble, was erected in the ante-chapel of Trinity College. He is represented standing on a pedestal in a loose gown, holding a prism, and looking upwards with an expression of deep and successful thought. On the pedestal is the inscription,—

Qui genus humanum ingenio superavit.¹

This statue, an engraving of which, taken from a photograph by the Rev. W. Kingsley, forms the frontispiece to this volume, was executed by Roubilliac, and erected at the expense of Dr.

¹ Qui genus humanum ingenio superavit, et omnes
 Perstrinxit Stellas exortus ut Ethereus Sol.—*Lucretius*.
 In genius who surpassed mankind as far
 As does the mid-day Sun the midnight Star.—*Dryden*.

Robert Smith, the author of the *Compleat System of Optics*, and Professor of Astronomy and Experimental Philosophy at Cambridge. The statue has been thus described by a modern poet :—

Hark where the organ full and clear,
With loud hosannahs charms the ear ;
Behold, a prism within his hands,
Absorbed in thought great Newton stands ;
Such was his brow, and looks serene,
His serious gait and musing mien,
When taught on eagle wings to fly,
He traced the wonders of the sky ;
The chambers of the sun explored,
Where tints of thousand hues were stored.

Dr. Smith likewise bequeathed the sum of £500 for executing a painting on glass for the window at the south end of Trinity College, Cambridge. The subject represents the presentation of Sir Isaac Newton to his Majesty George III., who is seated under a canopy with a laurel chaplet in his hand, and attended by the British Minerva, apparently advising him to reward merit in the person of the great philosopher. Below the throne, the Lord Chancellor Bacon is, by an anachronism legitimate in art, proposing to register the reward about to be conferred upon Sir Isaac. The original drawing of this picture was executed by Cypriani, and cost one hundred guineas.

A colossal statue in bronze, executed by Mr. Theed, was erected in honour of Sir Isaac Newton on St. Peter's Hill, Grantham, in 1858. It represents the philosopher in the costume of the day, and in the gown of a Master of Arts, in the act of lecturing, his right hand pointing to a diagram taken from the *Principia*, and drawn upon a scroll in his left hand. The figure is twelve feet high, and weighs upwards of two tons, half of which, in the shape of old cannon, was contributed by Government. The pedestal which supports the statue is fourteen feet high, and was executed from Mr. Theed's design by

Mr. Rogers, from the marble quarries near Holyhead. The total height of the monument is twenty-six feet. The statue faces the west, and looks down upon the road along which Sir Isaac must have walked on his way to Grantham.¹

This noble monument was inaugurated by Lord Brougham on the 21st September 1858 in an eloquent oration, which has been translated into French, and published in Paris, along with his discourse on Popular Literature, read at the meeting of the Association for the Promotion of Social Science, which was held at Liverpool in 1858.

The personal estate of Sir Isaac Newton, which was worth about £32,000, was divided among his four nephews and four nieces of the half-blood, the grandchildren of his mother by the Rev. Mr. Smith. The family estates of Woolsthorpe and Susterne went to John Newton, the heir-at-law, whose great-grandfather was Sir Isaac's uncle. This gentleman sold them in 1732 to Edmund Turnor, Esq. of Stoke Rocheford.² A short time before his death, Sir Isaac gave away an estate in the parish of Baydon, in Wiltshire, to the sons and daughter of a brother of Mrs. Conduitt,³ who, in consequence of their father dying before Sir Isaac, had no share in the personal estate; and he also gave an estate of the same value, which he bought at Kensington, to Catherine, the only daughter of Mr. Conduitt, who afterwards married Mr. Wallop. This lady was afterwards Viscountess Lymington, and the estate of Kensington descended to the Earl of Portsmouth, by whom it was sold. Sir Isaac

¹ The amount of the subscription for the monument was £1630, of which £600 was from Grantham and its vicinity.

² Turnor's *Collections*, &c., p. 158. See APPENDIX, No. XXXI.

³ These were Robert and Newton Barton, and Mrs. Burr, the children of Colonel Barton. This branch of the family became extinct by the death of the Rev. John Barton. The present Charles Cutts Barton, Esq., is the heir-male of Geoffrey Barton, a half-brother of Mr. Conduitt, and the great-grandson of the widow of Colonel Barton, by her marriage with Colonel Gardner, whose only daughter married the Rev. Cutts Barton, Dean of Bristol.

was succeeded as Master and Worker in the Mint by his nephew, John Conduitt, Esq.¹

¹ Mr. Conduitt's appointment to this office was announced in the Gazette immediately after the official notification of Sir Isaac's funeral. In a MS. entitled *Memorandums touching Mr. John Conduitt*, it is stated that he went to Westminster School on the 28th June 1691,—to Westminster College in June 1701,—and, in June 1705, to Trinity College, Cambridge, where he continued till June 1707. On the 8th July he set out on his travels to Holland, Germany, &c., and returned in May 1710. Between 1710 and 1711 he went twice to Portugal, and in 1713 he visited Gibraltar, from which he returned in May 1717. On the 26th of August 1717, he was married to "Mrs. Katherine Barton" in Russell-Court Chapel, as proved by the marriage certificate now before me, written on vellum, signed by John Heylin, minister (a fellow-student of Conduitt's at Trinity, and afterwards Prebend of Westminster), and witnessed by Bernard Fletcher Clark, and Anne Powell. He sat in Parliament for Whitchurch in the Parliaments which met on March 17, 1715, October 9, 1722, and January 23, 1728. He was re-elected in 1717, after his appointment to the Mint. In 1734, when he was elected both for Southampton and Whitchurch, he had the same number of votes at Southampton as his competitor, Anthony Hanley, but as this gentleman was found not to be duly elected, Mr. Conduitt made his election for Southampton. He was born in 1688, and died at Cranbury on the 20th May 1737, in the forty-ninth year of his age. His widow, Mrs. Conduitt, erected in 1738 a handsome monument to his memory in Westminster Abbey. Mrs. Conduitt died on the 20th January 1739, in the fifty-ninth year of her age.

CHAPTER XXVII.

Permanence of Newton's Reputation—Character of his Genius—His method of Investigation similar to that used by Galileo—Error in ascribing his Discoveries to the use of the Methods recommended by Lord Bacon—The pretensions of the Baconian Philosophy examined—Sir Isaac Newton's Social, Religious, and Moral Character—His Hospitality and Mode of Life—His Generosity and Charity—His Personal Appearance—Statues and Pictures of him—Memorials and Recollections of him—His Manuscripts and Papers.

SUCH were the last days of Sir Isaac Newton, and such the laurels that were shed over his grave. A century of discoveries has, since his time, been added to science; but brilliant as these discoveries are, they have not obliterated the minutest of his labours, and have served only to brighten the halo which encircles his name. The achievements of genius, like the source from which they spring, are indestructible. Acts of legislation and deeds of war may confer a high celebrity, but the reputation which they bring is local and transient; and while they are hailed by the nation which they benefit, they are reprobated by the people whom they ruin or enslave. The labours of science, on the contrary, bear along with them no counterpart of evil. They are the liberal bequests of great minds to every individual of their race; and wherever they are welcomed and honoured, they become the solace of private life, and the ornament and bulwark of the commonwealth.

The importance of Sir Isaac Newton's discoveries has been sufficiently exhibited in the preceding chapters. The peculiar character of his genius, and the method which he pursued in

his inquiries, can be gathered only from the study of his works, and from the history of his individual labours. Were we to judge of the qualities of his mind from the early age at which he made his principal discoveries, and from the rapidity of their succession, we should be led to ascribe to him that quickness of penetration, and that exuberance of invention, which is more characteristic of poetical than of philosophical genius. But we must recollect that Newton was placed in the most favourable circumstances for the development of his powers. The flower of his youth, and the vigour of his manhood, were entirely devoted to science. No injudicious guardian controlled his ruling passion, and no ungenial studies or professional toils interrupted the continuity of his pursuits. His discoveries were therefore the fruit of persevering and unbroken study; and he himself declared, that whatever service he had done to the public was not owing to any extraordinary sagacity, but solely to industry and patient thought.

Initiated early into the abstractions of geometry, he was deeply imbued with her cautious spirit: and if his acquisitions were not made with the rapidity of intuition, they were at least firmly secured; and the grasp which he took of his subject was proportional to the mental labour which it had exhausted. Overlooking what was trivial, and separating what was extraneous, he bore down with instinctive sagacity on the prominences of his subject, and having thus grappled with its difficulties, he never failed to entrench himself in its strongholds.

To the highest powers of invention Newton added, what so seldom accompanies them, the talent of simplifying and communicating his profoundest speculations.¹ In the economy of her distributions, nature is seldom thus lavish of her intellectual gifts. The inspired genius which creates is rarely conferred

¹ This valuable faculty characterizes all his writings, whether theological, chemical, or mathematical; but it is peculiarly displayed in his *Treatise on Universal Arithmetic*, and in his *Optical Lectures*.

along with the matured judgment which combines, and yet, without the exertion of both, the fabric of human wisdom could never have been reared. Though a ray from heaven kindled the vestal fire, yet an humble priesthood was required to keep alive the flame.

The method of investigating truth by observation and experiment, so successfully pursued in the *Principia*, has been ascribed by some modern writers of celebrity to Lord Bacon; and Sir Isaac Newton is represented as having owed all his discoveries to the application of the principles of that distinguished writer. One of the greatest admirers of Lord Bacon has gone so far as to characterize him as a man who has had no rival in the times which are past, and as likely to have none in those which are to come. In a eulogy so overstrained, we feel that the language of panegyric has passed into that of idolatry; and we are desirous of weighing the force of arguments which tend to depose Newton from the high-priesthood of nature, and to unsettle the proud destinies of Copernicus, Galileo, and Kepler.

That Bacon was a man of powerful genius, and endowed with varied and profound talent,—the most skilful logician,—the most nervous and eloquent writer of the age which he adorned, are points which have been established by universal suffrage. The study of ancient systems had early impressed him with the conviction that experiment and observation were the only sure guides in physical inquiries; and, ignorant though he was of the methods, the principles, and the details of the mathematical sciences, his ambition prompted him to aim at the construction of an artificial system by which the laws of nature might be investigated, and which might direct the inquiries of philosophers in every future age. The necessity of experimental research, and of advancing gradually from the study of facts to the determination of their cause, though the groundwork of Bacon's method, is a doctrine which was not only inculcated, but successfully followed by preceding philosophers. In a letter from Tycho Brahe to Kepler, this indus-

trious astronomer urges his pupil "to lay a solid foundation for his views by actual observation, and then by ascending from these to strive to reach the causes of things;" and it was no doubt under the influence of this advice that Kepler submitted his wildest fancies to the test of observation, and was conducted to his most splendid discoveries. The reasonings of Copernicus, who preceded Bacon by more than a century, were all founded upon the most legitimate induction. Dr. Gilbert had exhibited in his *Treatise on the Magnet*¹ the most perfect specimen of physical research. Leonardo da Vinci had described in the clearest manner the proper method of philosophical investigation;² and the whole scientific career of Galileo was one continued example of the most sagacious application of observation and experiment to the discovery of general laws. The names of Paracelsus, Van Helmont, and Cardan, have been ranged in opposition to this constellation of great names; and while it is admitted that even they had thrown off the yoke of the schools, and had succeeded in experimental research, their credulity and their pretensions have been adduced as a proof that to the "bulk of philosophers" the method of induction was unknown. The fault of this argument consists in the conclusion being infinitely more general than the fact. The errors of these men were not founded on their ignorance, but on their presumption. They wanted the patience of philosophy, and not her methods. An excess of vanity, a waywardness of fancy, and an insatiable appetite for that species of passing fame which is derived from eccentricity of opinion, moulded the reasonings and disfigured the writings of these ingenious men; and it can scarcely admit of a doubt, that, had they lived in the present age, their philosophical character would have received the same impress from the peculiarity of their tempers

¹ *De Magnete*, pp. 42, 52, 169, and Preface, p. 30.

² See *Essai sur les Ouvrages Physico-mathématiques de Leonard de Vinci*, par J. B. Venturi. Paris, 1799, pp. 32, 33, &c. See also Carlo Amoretti's *Memorie storiche su la vita gli studi e le Opere de Leonardo da Vinci*. Milano, 1804.

and dispositions. This is an experiment, however, which cannot now be made ; but the history of modern science supplies the defect, and the experience of every man furnishes a proof, that in the present age there are philosophers of elevated talents and inventive genius who are as impatient of experimental research as Paracelsus, as fanciful as Cardan, and as presumptuous as Van Helmont.

Having thus shown that the distinguished philosophers who flourished before Bacon were perfect masters both of the principles and practice of inductive research, it becomes interesting to inquire whether or not the philosophers who succeeded him acknowledged any obligation to his system, or derived the slightest advantage from his precepts. If Bacon constructed a method to which modern science owes its existence, we shall find its cultivators grateful for the gift, and offering the richest incense at the shrine of a benefactor whose generous labours conducted them to immortality. No such testimonies, however, are to be found. Nearly two hundred years have gone by, teeming with the richest fruits of human genius, and no grateful disciple has appeared to vindicate the rights of the alleged legislator of science. Even Newton, who was born and educated after the publication of the *Novum Organon*, never mentions the name of Bacon or his system ; and the amiable and indefatigable Boyle treated him with the same disrespectful silence. When we are told, therefore, that Newton owed all his discoveries to the method of Bacon, nothing more can be meant than that he proceeded in that path of observation and experiment which had been so warmly recommended in the *Novum Organon* ; but it ought to have been added, that the same method was practised by his predecessors ; that Newton possessed no secret that was not used by Galileo and Copernicus ; and that he would have enriched science with the same splendid discoveries if the name and the writings of Bacon had never been heard of.¹

¹ "The man who first discovered that cold freezes water, and that heat turns it into

From this view of the subject we shall now proceed to examine the Baconian process itself, and consider if it possesses any merit as an artificial method of discovery, or if it is at all capable of being employed, for this purpose, even in the humblest walks of scientific inquiry.

The process of Lord Bacon, was, we believe, never tried by any philosopher but himself. As the subject of its application, he selected that of heat. With his usual erudition, he collected all the facts which science could supply—he arranged them in tables—he cross-questioned them with all the subtlety of a pleader—he combined them with all the sagacity of a judge—and he conjured them by all the magic of his exclusive processes. But, after all this display of physical logic, nature thus interrogated was still silent. The oracle which he had himself established refused to give its responses, and the ministering priest was driven with discomfiture from his shrine. This example, in short, of the application of his system will remain to future ages as a memorable instance of the absurdity of attempting to fetter discovery by any artificial rules.

Nothing even in mathematical science can be more certain than that a collection of scientific facts are of themselves incapable of leading to discovery, or to the determination of general laws, unless they contain the predominating fact or relation in which the discovery mainly resides. A vertical column of arch-stones possesses more strength than the same materials arranged in an arch without the key-stone. However nicely they are adjusted, and however nobly the arch may spring, it never can possess either equilibrium or stability. In this comparison all the facts are supposed to be necessary to the final result; but, in the inductive method, it is im-

vapour, proceeded on the same general principles and on the same method by which Newton discovered the law of gravitation, and the properties of light. His *Regule Philosophandi* are maxims of common sense, and are practised every day in common life; and he who philosophizes by other rules, either concerning the material system or concerning the mind, mistakes his aim."—Reid's *Inquiry into the Human Mind*. Introduction.

possible to ascertain the relative importance of any facts, or even to determine if the facts have any value at all, till the master fact which constitutes the discovery has crowned the zealous efforts of the aspiring philosopher. The mind then returns to the dark and barren waste over which it has been hovering ; and by the guidance of this single torch it embraces, under the comprehensive grasp of general principles, the multifarious and insulated phenomena which had formerly neither value nor connexion. Hence it must be obvious to the most superficial thinker, that discovery consists either in the detection of some concealed relation—some deep-seated affinity which baffles ordinary research, or in the discovery of some simple fact which is connected by slender ramifications with the subject to be investigated ; but which, when once detected, carries us back by its divergence to all the phenomena which it embraces and explains.

In order to give additional support to these views, it would be interesting to ascertain the general character of the process by which a mind of acknowledged power actually proceeds in the path of successful inquiry. The history of science does not furnish us with much information on this head, and if it is to be found at all, it must be gleaned from the biographies of eminent men. Whatever this process may be in its details, if it has any, there cannot be the slightest doubt that in its generalities at least it is the very reverse of the method of induction. The impatience of genius spurns the restraints of mechanical rules, and never will submit to the plodding drudgery of inductive discipline. The discovery of a new fact unfits even a patient mind for deliberate inquiry. Conscious of having added to science what had escaped the sagacity of former ages, the ambitious discoverer invests his new acquisition with an importance which does not belong to it. He imagines a thousand consequences to flow from his discovery : he forms innumerable theories to explain it, and he exhausts his fancy in trying all its possible relations to recognised difficulties and unexplained

facts. The reins, however, thus freely given to his imagination, are speedily drawn up. His wildest conceptions are all subjected to the rigid test of experiment, and he has thus been hurried by the excursions of his own fancy into new and fertile paths, far removed from ordinary observation. Here the peculiar character of his own genius displays itself by the invention of methods of trying his own speculations, and he is thus often led to new discoveries far more important and general than that by which he began his inquiry. For a confirmation of these views, we may refer to the history of Kepler's Discoveries ; and if we do not recognise them to the same extent in the labours of Newton, it is because he kept back his discoveries till they were nearly perfected, and therefore withheld the successive steps of his inquiries.¹

The social character of Sir Isaac Newton was such as might have been expected from his intellectual attainments. He was modest, candid, and affable, and without any of the eccentricities of genius, suiting himself to every company, and speaking of himself and others in such a manner that he was never even suspected of vanity. "But this," says Dr. Pemberton, "I immediately discovered in him, which at once both surprised and charmed me. Neither his extreme great age, nor his universal reputation, had rendered him stiff in opinion, or in any degree elated. Of this I had occasion to have almost daily experience. The remarks I continually sent him by letters on the *Principia* were received with the utmost goodness. These were, so far from being anyways displeasing to him, that on the contrary they occasioned him to speak many kind things of

¹ The following interesting anecdote is related in Conduitt's MSS. :—"When Sir A. Fountaine was at Berlin with Leibnitz in 1701, and at supper with the Queen of Prussia, she asked Leibnitz his opinion of Sir Isaac Newton. Leibnitz said that taking mathematicians from the beginning of the world to the time when Sir Isaac lived, what he had done was much the better half; and added that he had consulted all the learned in Europe upon some difficult points without having any satisfaction, and that when he applied to Sir Isaac, he wrote him in answer by the first post, to do so and so, and then he would find it."

me to my friends, and to honour me with a public testimony of his good opinion."

The modesty of Sir Isaac Newton, in reference to his great discoveries, was not founded on any indifference to the fame which they conferred,¹ or upon any erroneous judgment of their importance to science. The whole of his life proves, that he knew his place as a philosopher, and was determined to assert and vindicate his rights. His modesty arose from the depth and extent of his knowledge, which showed him what a small portion of nature he had been able to examine, and how much remained to be explored in the same field in which he had himself laboured. In the magnitude of the comparison he recognised his own littleness; and a short time before his death he uttered this memorable sentiment: "I do not know what I may appear to the world, but to myself I seem to have been only like a boy playing on the sea-shore, and diverting myself in now and then finding a smoother pebble or a prettier shell than ordinary, whilst the great ocean of truth lay all undiscovered before me." What a lesson to the vanity and presumption of philosophers,—to those especially who have never even found the smoother pebble or the prettier shell! What a preparation for the latest inquiries, and the last views of the decaying spirit,—for those inspired doctrines which alone can throw a light over the dark ocean of undiscovered truth!

¹ The following anecdote is recorded by Conduitt, as showing Sir Isaac's indifference to fame:—"Mr. Molyneux related to us that after he and Mr. Graham and Dr. Bradley had put up a perpendicular telescope at Kew, to find out the parallax of the fixed stars, they found a certain nutation of the earth which they could not account for, and which Molyneux told me he thought destroyed entirely the Newtonian system: and therefore he was under the greatest difficulty how to break it to Sir Isaac. And when he did break it by degrees, in the softest manner, all Sir Isaac said in answer was, when he had told me his opinion, '*It may be so, there is no arguing against facts and experiments,*—so cold was he to all sense of fame at a time when, as Tillotson said, a man has formed his last understanding.'" This conversation must have taken place in 1726, when Molyneux's instrument was in use at Kew; but the nutation, though proposed at that time as an explanation of the change of declination of γ Draconis, was not discovered till 1747 by Bradley.—See Rigaud's *Life of Bradley*, p. lxii. and pp. 2, 3.

In the religious and moral character of our author, there is much to admire and to imitate. While he exhibited in his life and writings an ardent regard for the general interests of religion, he was at the same time a firm believer in Revelation. He was too deeply versed in the Scriptures, and too much imbued with their spirit, to judge harshly of other men who took different views of them from his own. He cherished the great principles of religious toleration, and never scrupled to express his abhorrence of persecution, even in its mildest form. Immorality and impiety he never permitted to pass unreprieved. When Vigani told him "a loose story about a nun," he gave up his acquaintance, and when Dr. Halley¹ ventured to say anything disrespectful to religion, he invariably checked him, with the remark, "I have studied these things,—you have not."

He considered cruelty to "brute beasts" as a violation of Christian morality, and such was his tenderness for the lower creation, that he could not tolerate the sports of hunting or shooting animals. When Mr. Conduitt was one day speaking favourably of a nephew of Sir Isaac's, he urged it as an objection against him, "that he loved killing of birds."²

The native simplicity of Sir Isaac Newton's mind is finely portrayed in the affecting letter in which he acknowledges to Locke, that he had thought and spoken of him uncharitably; and the humility and candour in which he asks forgiveness could have emanated only from a mind as noble as it was pure.

¹ Mr. Hearne, in a memorandum dated April 4, 1726, states that a great quarrel happened between Sir Isaac Newton and Mr. Halley. We have not been able to find any traces of it. If we suppose the above date to be 1727, the rumour of a quarrel may have originated in the fact, that on the 2d March 1727, Sir Isaac had called attention to the omission on Halley's part, as Astronomer-Royal, to send to the Society a copy of his Annual Observations, as required by the late Queen's letter.—See *Memoirs of the Astronomical Society*, vol. viii. p. 188.

² "Whiston," says Mrs. Conduitt, "had spread it abroad that Sir Isaac abstained from eating rabbits because strangled, and from black puddings, because made of blood. This," she adds, "is not true. Sir Isaac said that meats strangled were forbidden, because that was a painful death, and the letting out the blood the easiest,—that animals should be put to as little pain as possible, and that the reason why eating blood was forbidden, was because it was thought eating of blood inclined men to be cruel.—C. C."

When Locke wrote to Sir Peter King that Newton "is a nice man to deal with, and a little too apt to raise in himself suspicions where there is no ground," he referred to an imperfection of character which we have not scrupled to notice, whether in his controversies with Hooke or with Flamsteed. It would be a sacrifice of truth, and an empty compliment to the memory of so great a man, to speak of him as exempt from the infirmities of our common nature. When Bishop Burnet has said that he valued him for something still more valuable than all his philosophy—for having the *whitest* soul he ever knew—we may well decline to search for shades on a tablet so pure. It is far from the duty of a biographer, who has been permitted to inspect the private and sacred relics of the dead, to sit in judgment on the failings they may disclose. It is enough that he deals honestly with what is known, and makes no apology for what is socially or morally wrong. Other biographers are under no such restraint. In searching even the recesses of great minds for the manifestation of a common humanity, the philosopher may throw light upon those compensatory adjustments by which great talents and high position are sometimes united with social and even moral failings. If in estimating the character of Newton, Professor De Morgan has pointed out more conspicuously than other biographers the failings to which we have referred, he has yet drawn his character with such tenderness and truth, that we accept of it as a noble tribute to the noblest of our race. "It is enough," he says, "that Newton is the greatest of philosophers, and one of the best of men;"—that "we cannot find in his character an acquired failing;"—"that all his errors are to be traced to a disposition which seems to have been born with him; and that, admitting them in their fullest extent, he remains an object of unqualified wonder, and all but unqualified respect." Nor is the tribute of the poet less just than that of the mathematician. When Pope expressed a wish for "some memoirs and character of Newton as a private man," he did "not doubt that his life

and manners would make as great a discovery of virtue and goodness and rectitude of heart, as his works have done of penetration and the utmost stretch of human knowledge.”¹

After Sir Isaac took up his residence in London, he lived in a very handsome style, and kept his carriage, with an establishment of three male and three female servants. In his own house he was hospitable and kind, and on proper occasions he gave splendid entertainments, though without ostentation or vanity. In his diet he was frugal, and in all his habits temperate. When he was asked to take snuff or tobacco, he declined, remarking “that he would make no necessities to himself.” His dress was always simple, but on one occasion, when he opposed the Honourable Mr. Annesley in 1705, as a candidate for the University, he is said to have put on a suit of laced clothes.

Sir Isaac does not appear to have had much taste for the fine arts. He used to say of his friend the Earl of Pembroke, “that he was a lover of *stone dolls*.”² Notwithstanding his dislike of sculpture, he seems to have been considered a judge of pictures. He was chosen a “Commissioner for Paintings, and having a dispute with Archbishop Wake, whom he opposed, he told a story of a Bishop who said on that subject, ‘that when this snow (pointing to his grey hairs) falls, there will be a great deal of dirt in churches.’ After this he went to no more of their meetings.”³

His generosity and charity had no bounds, and he used to remark, that they who gave away nothing till they died, never gave at all. Though his wealth had become considerable by a prudent economy, yet he had always a contempt for money, and he spent a considerable part of his income in relieving the poor—in assisting his relations,⁴ and in encouraging ingenuity

¹ Pope's letter to Conduitt. See APPENDIX, No. XXV.

² *Conduitt's MSS.*

³ This anecdote, which may relate to the putting up of pictures in churches, I have given in the words of Mrs. Conduitt, with whose initials it is signed.

⁴ “He was very kind to all the Ayscoughs. To one he gave £800, to another £200, and to a third £100, and many other sums; and other engagements did he enter into

and learning.¹ He was scrupulously exact and regular in all matters of business ; and though he disregarded money, allowing his rents often to remain unpaid, he had a deep sense of justice, and was very strict in demanding from his tenants at Woolsthorpe, even in very small matters, a rigorous performance of their obligations.² His conduct, however, was not always influenced by this principle. When he had been imposed upon in purchasing an estate at Baydon, in Wiltshire, for which he had paid double its value, and was told that "he might vacate the bargain in equity," he replied, "that he would not for the sake of two thousand pounds go into Westminster Hall to tell that he had been made a fool of."³ The same unwillingness to have recourse to legal proceedings showed itself on another occasion. He one day missed bank bills to the amount of upwards of £3000, and he suspected that his pocket had been picked by W. Whiston, a nephew of Whiston, who had bought an estate in land of that value without any

also for them. He was the ready assistant of all who were any way related to him—to their children and grandchildren."—*Annual Register*, 1776, vol. xix. p. 25. He gave a regular allowance to his niece, Mrs. Pilkington, and on the 12th August 1725, he presented £100 to Mary Clarke to "augment her portion."

¹ He gave money to Stirling, and brought him from Venice ; and in 1719 and 1720 he presented to Pound, the astronomer, one hundred guineas, in two gifts of fifty guineas each.—Rigaud's *Bradley*, p. iii., in note.

² In 1687-8 he had a law-suit with Mr. Storer, his tenant at Woolsthorpe, in order to compel him to scour the drains, and repair the thatch, and the walls, and palings of the swine-cot and cow-house, which he was bound by his lease to leave in good order. I have found the scroll of a long and characteristic letter addressed to a friend, "who had undertaken the office of an arbitrator." He thanks him for doing so, and expresses his hearty wish that he "may inherit the blessing promised to peace-makers."—See APPENDIX, No. XXXII.

There is another scroll of a short letter to "Cosin John Newton," his heir-at-law, written about May 1720, and of a similar character. "I understand," he says, "that Thomas Hubbard agreed with you to leave his farm at Lady-day next, and that I was to allow him ten pounds for his manure. But now I am told that he would become tenant to it at eleven pounds per annum. This would be departing from the bargain already made, in order to make a new one. But there being sufficient witnesses of the bargain already made, I expect that he stand to it, and I desire you to demand it of him in my name, and to send me his answer, if he refuses to sign articles pursuant to what has been already agreed upon."

³ *Conduitt's MSS.*

visible means of paying for it. Notwithstanding the magnitude of the loss, he could not be prevailed upon to prosecute the supposed delinquent, and when Mr. Conduitt asked him how much he had lost, he only answered "too much."¹

His liberality, indeed, was in some instances excessive. On one occasion he offered Cheselden as a fee a handful of guineas out of his coat pocket, and when he refused them, saying that a guinea or two was the most he ought to have, Sir Isaac laughing said, "Suppose I do give you more than your fee."² To Dr. Cheyne, who refused to take money from him, he was less indulgent. According to a statement made by Dr. Arbuthnot to Conduitt, he one day told Sir Isaac that Dr. Cheyne had written an ingenious book on mathematics, but that he had not money to print it. "Bring it to me," said Sir Isaac; and when the manuscript was brought to him, he offered Cheyne a bag of money, which he refused, and "Newton would see him no more."³

The habits of deep meditation which Sir Isaac Newton had acquired, though they did not show themselves in his intercourse with society, exercised their full influence over his mind when in the midst of his own family. Absorbed in thought he would often sit down on his bedside after he rose, and remain there for hours without dressing himself, occupied with some interesting investigation which had fixed his attention. Owing to the same absence of mind, he neglected to take the requisite quantity of nourishment, and it was therefore often necessary to remind him of his meals.⁴

In his personal appearance, Sir Isaac Newton was not above the middle size, and in the latter part of his life was inclined to be corpulent. According to Mr. Conduitt, "he had a very lively and piercing eye, a comely and gracious aspect, with a fine head of hair as white as silver, without any baldness, and when his peruke was off was a venerable sight." Bishop Atter-

¹ *Conduitt's MSS.*

² *Ibid.*

³ *Ibid.*

⁴ See this volume, pp. 48 and 52.

bury asserts,¹ on the other hand, that the lively and piercing eye did not belong to Sir Isaac during the last twenty years of his life. "Indeed," says he, "in the whole air of his face and make there was nothing of that penetrating sagacity which appears in his compositions. He had something rather languid in his look and manner which did not raise any great expectation in those who did not know him." This opinion of Bishop Atterbury is confirmed by an observation of Mr. Thomas Hearne,² who says that "Sir Isaac was a man of no very promising aspect. He was a short well-set man. He was full of thought, and spoke very little in company, so that his conversation was not agreeable. When he rode in his coach one arm would be out of his coach on one side, and the other on the other." Sir Isaac never wore spectacles, and never "lost more than one tooth to the day of his death."

Beside the statue of Sir Isaac Newton executed by Roubilliac, there is a bust of him by the same artist in the library of Trinity College, Cambridge.³ Several good paintings of him are extant. Two of these are in the hall of the Royal Society of London, and have, we believe, been often engraved. Another, by Vanderbank, is in the small combination-room in Trinity College, and has been engraved by Vertue. Another, by Valentine Ritts, is in the Hall of Trinity College; but the best, from which the frontispiece to Volume I. is copied, was painted by Sir Godfrey Kneller, and is in the possession of Lord Egremont at Petworth.⁴ At Hurtsbourne Park there are several

¹ *Epistolary Correspondence*, vol. i. p. 180. Sect. 77.

² MSS. Memoranda in the Bodleian Library.

³ It is not true, as has been stated, that the original of this bust is in the possession of the Marquis of Lansdowne. The bust of Newton at Bowood Park is a copy of the one in the Library of Trinity, executed for his Lordship by Bailey.

⁴ "I have taken," says Dr. Stukely, "several sketches from his side face, which are very like him. I being present with him and Sir Godfrey (Kneller) at painting his great picture to be sent to France, desired Sir Isaac to let Sir Godfrey paint his side face, a profile as we call it, for me. 'What!' said Sir Isaac, 'would you make a medal of me?' and refused it, though I was then in highest favour with him."—Stukely's *Letter to Conduitt*, Grantham, July 22, 1727.

portraits of Newton, the most interesting of which,¹ taken in his old age by Sir James Thornhill, is in the chapel, representing him at full length, seated on a chair, and in his own hair.² In Trinity College Library there is a cast from his face after death, by Roubilliac, from which the following engraving is taken, after a photograph from the cast by the Rev. Mr. Kingsley.

Every memorial of so great a man as Sir Isaac Newton has been preserved and cherished with peculiar veneration. His house at Woolsthorpe, of which we have given an engraving, has been religiously protected by Mr. Turnor of Stoke Roche-

¹ Owing to the state of the varnish, Mr. Henneman tried in vain to obtain a photograph of this picture, for the purpose of being engraved for this work.

² In the Library of the University of St. Andrews there is a mezzotinto portrait of Sir Isaac, with the following inscription in capital letters beneath the picture:—

SIR ISAAC NEWTON.

Drawn and scraped, MDCCLX, by James Macardel, from an original portrait painted by Enoch Seeman, now in the possession of Thomas Willis, F.R. and A.SS.

Les Italiens, ces peuples ingénieux, ont craint de penser. Les Français n'ont osé penser qu'à demie, et les Anglais, qui ont volé jusqu'au ciel, *parcequ'on ne leva point coupé les ailes*, sont devenu les précepteurs des nations. Nous leur devons tout depuis les loix primitives de la gravitation, depuis le calcul de l'infini, et la connaissance précise de la lumière, si vainement combattues, jusqu'à la nouvelle charrue et à l'insertion de la petite vérole combattues encore.—*Ode sur la mort de Madame de Bareilh, avec une lettre par* MONS. DE VOLTAIRE.

ford, the proprietor. Dr. Stukely, who visited it in Sir Isaac's lifetime on the 13th October 1721, gives the following description of it in his letter to Dr. Mead, written in 1727 :—
 “'Tis built of stone, as is the way of the country hereabouts, and a reasonable good one. They led me up stairs and showed me Sir Isaac's study, where I suppose he studied when in the country in his younger days, or perhaps when he visited his mother from the University. I observed the shelves were of his own making, being pieces of deal boxes which probably he sent his books and clothes down in on those occasions. There were some years ago two or three hundred books in it of his father-in-law, Mr. Smith, which Sir Isaac gave to Dr. Newton of our town.”¹

When the house was repaired in 1798, a tablet of white marble was put up by Mr. Turnor in the room where Sir Isaac was born, with the following inscription :—

“Sir Isaac Newton, son of John Newton, Lord of the Manor of Woolsthorpe, was born in this room on the 25th December 1642.”

Nature and Nature's laws lay hid in night,
 God said, “Let Newton be,” and all was Light.²

The following lines have been written upon the house :—

Here Newton dawned, here lofty wisdom woke,
 And to a wondering world divinely spoke.
 If Tully glowed, when Phædrus' steps he trode,
 Or fancy formed Philosophy a God :
 If sages still for Homer's birth contend,
 The Sons of Science at this dome must bend.
 All hail the shrine ! All hail the natal day,
 Cam boasts his noon,—This *Cot* his morning ray.

The celebrated apple-tree, the fall of one of the apples of

¹ Turnor's Collections, p. 176.

² The original of these lines, which we have seen in Pope's own handwriting, is slightly different, and inferior to those in the text :—

Nature and all her laws lay hid in night,
 God said, “Let Newton be,” and all was Light.

which is said to have turned the attention of Newton to the subject of gravity, was taken up in 1820 in a state of decay.¹

Many interesting relics of Sir Isaac have been preserved with religious care. His reflecting telescope, as we have seen, is in the possession of the Royal Society of London; and in the Library of Trinity College, Cambridge, there is a large collection of articles which belonged to him—a terrestrial globe, a ring dial, a small brass quadrant, a mariner's compass, a parallel ruler, a pair of compasses, three locks of his silver-white hair, one of which was presented by Colonel C. Burr in 1835. The door of his book-case is in the museum of the Royal Society of Edinburgh. A descendant of Dr. Bentley possesses a watch presented to him by Newton in 1717;² and among the memorials given to the Royal Society by the Rev. Mr. Turnor, is a gold watch, said to have been presented by Mrs. Conduitt to Sir Isaac in January 1708.³ A chair, said to

¹ The anecdote of the falling apple is not mentioned by Dr. Stukely, nor by Pemberton, who conversed with Newton about the origin of his discoveries, and mentions the anecdote of Newton's sitting in a garden. I find, however, a reference to an apple-tree in the following memorandum by Conduitt. "In the same year (at his mother's in Lincolnshire), when musing in a garden it came into his thoughts that the same power of gravity, which made an apple fall from the tree to the ground, was not limited to a certain distance." See vol. i. p. 24, note.

After quoting some interesting passages from Kepler on gravity, Mr. Drinkwater Bethune justly remarks, "Who, after perusing such passages in the works of an author which were in the hands of every student of astronomy, can believe that Newton waited for the fall of an apple to set him thinking for the first time on the theory which has immortalized his name? An apple may have fallen, and Newton may have seen it; but such speculations as those which it is asserted to have been the cause of originating in him, had been long familiar to the thoughts of every one in Europe pretending to the name of Natural Philosopher."—*Life of Kepler*, p. 24. See vol. i. p. 235.

² "This is to acquaint you," says N. Facio, "that I have agreed with Mr. Benjamin Steele, the watchmaker, at £15, for him to make the watch for Dr. Bentley. It will be with four pierced rubies and four diamonds, and I hope will be worth the money."—Letter to Newton, dated Worcester, June 15, 1717.

³ This date is obviously an error, as Miss Barton did not become Mrs. Conduitt till 1717. Professor De Morgan, who examined it, says, "that any one who looks at the inscription will see that it is not an old watch. It is neither ornamented nor placed in a shield or other envelope, while the case is beautifully chased, and has an elaborate design representing Faune and Britannia examining the portrait of Newton."—*Notes and*

have been used by Sir Isaac, is in the possession of J. Hogarth, Esq., London. It was sent to Grantham when his statue was inaugurated, and was occupied by Lord Brougham on the platform. Mr. Hogarth has given an account of the manner in which it came into his possession,¹ but he has produced no evidence whatever to establish the genuineness of the relic.

One of the most interesting and valuable relics of Sir Isaac is a silver box, beautifully carved, which he presented to the Earl of Abercorn, the great-grandfather of Sir George Hamilton Seymour, G.C.B., who has kindly placed it in my hands. It is three and a half inches in diameter, and one and a half inch deep.² It bears on the lid the Hamilton arms, a crown surmounted by a tree crossed with a saw; and the bottom of it as well as the lid is carved with enigmatical numbers, forming a perpetual Julian Kalendar. When Sir George was our ambassador at Brussels in 1840, and at St. Petersburg in 1853, he submitted the box to Professor Quetelet and M. Otto Struve of Pulkova, who have given a satisfactory explanation³ of all

Queries, No. 210, p. 430. The dial-plate is obviously new. Mr. Turnor, in whose possession I saw the watch, told me that he purchased it in the Curiosity Shop at Warwick.

¹ King's *Biographical Sketch of Sir Isaac Newton*, p. 71.

² In the woodcut the light parts are silver, and the dark ground is filled up with a substance which is dark in all the compartments and shields containing numbers, and reddish in the merely ornamental portions.

³ The following is the explanation given by M. Otto Struve:—

“The engravings compose a perpetual Julian Kalendar, and one very complete for the first 38 years of the last century, but which may still be partly used at the present day and in the future.

“1. *The Lid of the Box.*

“The numbers in the 19 shields which form its periphery, give in the first lines the dates of Easter for the years from 1700 to 1738. The month of *March* is there indicated by ;, the month of *April* by A. In a shield (the 12th) we find also the sign + in the middle of two numbers of the *first* line (1 + 29). The sign here indicates that the *first* number belongs to the month of *April*, and the *second* to the month of *March*. In all the other cases the two numbers of the *first* line are those of the months indicated by the signs above mentioned.

“Each shield refers to two years, which are 19 years distant from one another. The *first* shield, which relates to the years 1700 and 1719, is that which is placed above the crown (beneath the Hamilton arms), and a little to the right. In setting out from this *first* shield in a direction to the right, the numbers in the *second* line indicate the two

the legends except the following, which is one of those upon the bottom of the box:—

Round For Sou : & Back For Shin : 4
 4 : 48 5 : 36 6 : 24 7 : 12 8
 From Sun Set or From Moons Rise

years after 1700 to which Easter corresponds in the first line. Such numbers are found only in each fourth shield between which the numbers corresponding to the intermediate years ought to be supplied. In place of numbers, the second line presents to us, for these intermediate years, the initials of the days of the week which refer to the dates given in the central square of the lid. All the dates in this central square fall upon the same day of the week, indicated for each year by the initials which we read in the second and in the third line of the peripheral shields. The sign + which we find near some of the initials, indicates that the corresponding year is leap year, and that for this reason the days of the week have made leaps of two days. In the shields where there are numbers in place of initials, we must supply the days of the week with the assistance of the initials in the adjoining shields.

“The initials in the third line of the peripheral shields are only the continuation of those in the second line. The numbers in the third line are the *golden numbers*, and correspond equally to the two years indicated in the second line. The large cross ✠ which is in the *eleventh* shield for the year 1710, indicates that in this year a new lunar cycle commences. For this year the golden number is 1. As in the second line in the shields, and also in the third line where there is no mark of initials, we must supply them with the assistance of the adjacent shields, and *vice versa* for the numbers.

“With respect to the central square, we must still add that the Roman numerals indicate the month,—No. I. signifying March; II. April, and so on. The Arabic numerals are the days of the month indicated above or below, to which correspond the initials of the days of the week in the peripheral shields. It is thus that, for example, for the year 1700 all the dates of the central square are Monday, for 1710 Saturday, &c. This part of the Kalendar may find an application even at present. For this purpose we must subtract 1700 from the year in question, and divide the difference by 28. The remainder is the year of the solar cycle for which we must seek in the peripheral shields the initial of the day of the week which corresponds, for the year in question, to the dates furnished by the central square.

“2. *The Bottom of the Box.*

“In the central rectangle the small arrows attached to the numbers point to the true solar time of sunset for the beginning of each month, Old Style, where they give the numbers of hours between the true noon and the rising or setting of the sun, that is, the semi-diurnal arc of the sun for the date in question. The months are there indicated as on the lid, by Roman cyphers. The Arabic numerals 4, 5, &c., are the entire hours, the half-hours being indicated by *fleur-de-lys*, and the quarters by points, and it is possible to obtain from this table the time required to two or three minutes nearly. This table is suited nearly to the latitude of London, the computer having neglected the effect of refraction.

“The elliptical compartments, both above and below the central rectangle, contain

Professor De Morgan's explanation of this compartment will be found below.¹

the equation of time. The letters in it are the initials of the names of the month, and the numbers indicate either the days of the month, or the quantity of the equation of time. The sign of the sun signifies that at the four dates near which it is found, the equation of time is *zero*. These four dates divide the year into four periods. For each of these periods the elliptical compartments give with their corresponding dates the maximum of the equation of time expressed in minutes and in seconds. In the two periods when this equation is greatest, we find also the dates at which the equation is $\frac{1}{4}$, $\frac{2}{3}$, or $\frac{3}{4}$ of the corresponding maximum. The sign \sim is a little obscure, but it may be satisfactorily explained if we suppose it to indicate that the numbers which are under it do not belong to the preceding maximum of the equation.

"The legend on the right side of the central rectangle gives the time of high water for the days of full moon, but these times differ considerably from those now observed.

"The legend on the left hand of the central rectangle is still a little enigmatic. The supposition of M. Quetelet, that the numbers in it are more precise indications of the hours of sunrise and sunset, cannot be correct, for these hours are given with more precision in the central rectangle. The constant difference of 48 minutes between each adjacent couple of numbers, makes us suppose, on the contrary, that these numbers relate to the relative diurnal motion of the sun and moon, which is confirmed also by the words in the legend.

"OTTO STRUVE.

"POULKOVA, $\frac{1}{3}$ April 1853."

¹ The word *Sou* may mean *Setting* or *Southing*. *Shin* means *Shining* or *Rising*. Upon the more probable supposition that *Sou* means *Setting*, the legend directs us to go *Round* for *Setting*, and *Back* for *Rising*, which would give—

	FROM BOX.		FROM HOPTON'S "CONCORDANCY OF YEARES."	
	Setting.	Rising.	Setting.	Rising.
Beginning of				
January,	4 ^h 0'	8 ^h 0'	4 ^h 0'	8 ^h 0'
February,	4 48	7 12	4 45	7 13
March,	5 36	6 24	5 41	6 19
April,	6 24	5 36	6 42	5 18
May,	7 12	4 48	7 35	4
June,	8 0	4 0	8 9	3 51
July,	8 0	4 0	8 0	4 0
August,	7 12	4 48	7 17	4 43
September,	6 24	5 36	6 19	5 41
October,	5 36	6 24	5 24	6 26
November,	4 48	7 12	4 26	7 34
December,	4 0	8 0	3 50	8 10

The last two columns are a part of the table of the sun's rising and setting from Arthur Hopton's "Concordancy of Yeares," 1615. In the last column of this table 7^h 13' is a misprint for 7^h 15'.

"If *sou* is to be read *southing*, it means that the southing is 4^h, 4^h 48', &c., after rising; but this is not the most likely meaning."

The manuscripts, letters, and other papers of Newton have been preserved in different collections. His correspondence with Cotes relative to the second edition of the *Principia*, and amounting to between sixty and a hundred letters, a considerable portion of the manuscript of that work, and five letters to Dr. Keill on the Leibnitzian controversy, are preserved in the Library of Trinity College, Cambridge, and have been published by Mr. Edleston in the interesting volume to which we have so often referred. Newton's letters to Flamsteed, about thirty-four in number, are deposited in the Library of Corpus Christi College, Oxford, and those of Flamsteed are at Hurtsbourne Park. In the British Museum, and in the Library of the Royal Society of London, there are many letters of Newton and his correspondents. Several letters of Newton, and a copy of the original specimen which he drew up of the *Principia*, exist among the papers of Mr. William Jones (the father of Sir William Jones), which are preserved at Shirburn Castle, in the library of Lord Macclesfield.¹ But the great mass of Newton's papers came into the possession of the Portsmouth family, through his niece, Lady Lymington, and have been safely preserved by that noble family. An account of many of the manuscripts has been given in the preceding pages, and several of the most important letters and papers will be found in the Appendix to this work.

¹ This tract, *De Motu*, occupying nineteen pages, and consisting of four theorems and seven problems, forms No. I. of the Appendix to Professor Rigaud's *Historical Essay on the Principia*, and is the same which Newton sent to Halley in November 1684.—See Edleston's *Correspondence*, p. lv., and vol. i. pp. 298, 305.

APPENDIX.

No. I.

(Referred to in page 23.)

THE Abbé Anthony Conti, or Conty, whose name appears so prominently in the Fluxionary controversy, was a noble Venetian, who obtained some distinction as a philosopher and a poet. He was born at Padua on the 22d January 1677, and, at the age of twenty-two, he retired to Venice into the Congregation of the Oratoire, where he became a priest, and remained nine years. Disgusted with the scholastic philosophy of the day, he studied Bacon and Locke, and devoted himself to the studies of mathematics, natural philosophy, and natural history, which he prosecuted at Padua. Having gone to Paris, where he was a favourite in society, he met with M. Remond de Montmort, an eminent mathematician, who accompanied him to England to observe the great solar eclipse of the 15th April 1715. He was then introduced to Newton, and was on very intimate terms with him. He took a great interest in his controversy with Leibnitz, but being acquainted also with the German philosopher, he found it difficult to take an impartial course between the two extreme opinions of the day. We shall meet with him again when we come to the consideration of Newton's Chronology, which was the ground of a serious difference with its author.¹ Conti wrote a philosophical poem entitled *Il Globo de Venere*, and four tragedies, which were published at Venice in 1739. He died at Padua on the 6th March 1749.

The following very interesting letter,² referred to in the text, was written to Brook Taylor, one of the Committee who drew up the report on the *Commercium Epistolicum*.

I.—LETTER OF THE ABBE CONTI TO BROOK TAYLOR.

“ MONSIEUR,

“ Je m'en vais vous expliquer en peu de mots les raisons qui m'ont engagé dans la querelle de Mons. Newton et de M. Leibnitz. Mr. Newton

¹ Conti's defence of himself, referred to in page 240, note, is published without his name in the *Bibliothèque Française* for May and June 1726. Amsterdam, pp. 182-193.

² From the *Life of Brook Taylor*, p. 121.

me pria d'assembler à la Société les Ambassadeurs et les autres Ministres étrangers. Il souhaitait qu'ils assistassent à la collation qu'on devoit faire des papiers originaux, qui se conservent dans les archives de la Société avec d'autres lettres de M. Leibnitz. Mr. le Baron de Kirmansegger¹ vint à la Société avec les Ministres des Princes ; et après que la collation des papiers fut faite, il dit tout haut, que cela ne suffisoit pas, que la véritable méthode pour finir la querelle, c'étoit que Mr. Newton luy-même écrivit une lettre à Mr. Leibnitz dans laquelle il luy proposât les raisons et en même tems luy demandât des réponses directes. Tous les Ministres des Princes qui étoient présents goûtèrent l'idée de Mr. Kirmansegger ; et le Roy même à qui on la proposa le soir, l'approuva, ayant dit tout cela à Mr. Newton, cinq ou six jours après il m'écrivit une lettre pour envoyer à Mr. Leibnitz à Hanover. Mr. Newton, peut-il dire que je l'ay prié de m'adresser cette lettre ? Cependant la nécessité, de l'envoyer à Hanover, et de l'accompagner d'une des miennes m'engagea dans la querelle. La lettre qui fut portée à Hanover par le Baron de Discou, resta plus d'un mois à Londres. Mad^{me} la Comtesse de Kirmansegger la fit traduire en François par M. Coste : le Roy la lut et l'approuva fort, en disant que les raisons étoient très simples et très claires, et qu'il étoit difficile de répondre à des faits. J'ay lu à Mons. Newton la lettre que j'écrivois à Mons. Leibnitz ; c'est Mr. de Moivre qui me l'avoit corrigé et j'en conserve encore la brouillon : Mr. de Moivre y-avoit ajouté quelque chose à l'égard de la manière équivoque dont Mr. Leibnitz avoit proposé le problème. Mr. Leibnitz fut fort irrité de la lettre que je luy avois envoyée, comme il paroît par sa réponse, et par des expressions assez fortes qu'il avoit avancées contre moy dans ses lettres à S. A. R. la Princesse de Galles. Il écrivit plusieurs lettres pour sa justification que j'ay donné à Mons. Newton à proportion qu'elles m'ont tombés dans les mains, Mr. Newton en fit une espèce de réponse qui fut imprimée avec la première lettre à la fin de l'Histoire des Fluxions ; les lettres que Mr. Leibnitz m'avoit adressées, furent aussi imprimées dans le même livre ; et *Mr. Leibnitz* [evidently a mistake for Mr. Newton] en fit non seulement ôter mon nom ; mais encore ne me fit aucune part qu'on les imprimoit. Quand Mr. de Mesaus² luy proposa de les imprimer de nouveau en Hollande, il luy donna son approbation, et dit même qu'il luy fourniroit quelque autre petit papier. J'ignore ce qui est arrivé d'après, parce que j'ay quitté l'Angleterre. On dit que Mr. Newton a changé de sentiment et qu'il se plaint de moy de l'avoir engagé dans la querelle avec Mr. Leibnitz ; je le prie très humblement de réfléchir à des faits qui sont incontestables ; et par lesquels il paroît assez que je n'ay eu d'autre part à la question qu'autant qu'il vouloit bien m'en faire. J'ay essuyé tous les reproches des Allemans, et de Mr. Leibnitz luy-même pour soutenir ses raisons. Je les ai aussi soutenus en France où malgré tout ce qu'on a l'adresse de luy écrire en Angleterre, on n'est pas trop dans ses intérêts comme il pense. J'ai pense un jour me brouiller avec un grand mathématicien, chez une Dame, où on parloit de cette dispute ; il soutenoit que tous les argumens du *Commercium Epistolicum* n'étoient pas concluans ; et que Mr. Newton n'y avoit aucune part, non plus qu'aux lettres qu'on avoit imprimées par son ordre. J'aurois bien d'autres choses à dire là-dessus ; mais je suis las d'entendre parler d'une matière qui n'est pas agréable. On a voulu me

¹ Kilmansegg or Kilmansegger.

² Des Maizeaux.

commettre avec Mr. Newton, et je ne sçay pas pourquoi ; je l'ay toujours honoré et respecté ; et je luy ay toujours dit la vérité sans aucun intérêt : mais si les plaintes continuent, je ne pourray pas me dispenser de faire imprimer la simple histoire d'un fait, qui fera voir au public que je n'ay pas prétendu me mêler dans cette querelle pour acquérir du nom. Mr., je suis

“ Votre très humble et très obéissant serviteur,
“ CONTY.”

“ A Paris, ce May 22, 1721.”

The following is the only letter from Conti to Newton which I have found among the Portsmouth Manuscripts :—

2.—LETTER FROM THE ABBE CONTI TO SIR ISAAC NEWTON.

HANOVER, 10 Decembre, 1716.

“ MONSIEUR,

“ Je vous demande pardon si je n'ay pas pu vous écrire jusque à cette heure. Je suis tombé malade depuis que je suis icy, et je ne suis pas encore revenu de ma maladie. Je n'ay vu ni Le Roy,¹ ni La Cour, et je suis obligé de garder la chambre depuis vingt jours.

“ M. Leibnitz est mort ; et la dispute est finie. Il a laissé plusieurs lettres et plusieurs manuscrits qu'on imprimera, aussi des manuscrits d'autres sçavants, une qui est Traité de M. Des-Cartes qui n'est point paru jusque ici. Il y a des Dialogues sur les articles de la Téodicea ; une instruction au Prince Eugène sur les exercices militaires ; une instruction au Czar pour faire fleurir les arts et les sciences dans son pais ; beaucoup des remarques sur la langue universelle, et sur l'étimologie des mots. Comme je espère que le Roy me donna la permission de voir les papiers je remarquerai s'il y a quelque chose touchant votre dispute, mais peut-estre qu'on cachera ce qui ne fait point d'honneur à la mémoire de M. Leibnitz. On a commencé de travailler sur sa vie. M. Wolfius aura le soin d'écrire tout ce qui appartient aux Mathématiques.

“ M. Leibnitz a travaillé pendant toute sa vie à inventer des machines qui n'ont point réussi. Il a voulu faire une espèce de moulin à vent pour les mines, un carosse qui tire sans chevaux, un carosse qui se change, un chaire à porteur, et un charette ; jusque des Souliers à ressort. Il y a deux modelles de sa machine arithmétique, mais elle est très composée, et on en dit qu'elle n'est à la fin que la machine de Pascal multipliée.

“ Vous aurez vu l'insolente dissertation, qu'on a imprimée dans les actes de Lipsic au mois de Juin. M. Bernoulli prétend à cette heure d'être l'inventeur de calcul intégral. Je suis sûr que la dissertation vous fera rire.

“ Je ne sçay pas si l'ambassadeur de Venise vous a prié de proposer à la Société Royal M. le Marquis Orsi Sénateur de Bologne, et un de plus grand sçavants que nous avons en Italie. Il est célèbre en France par plusieurs livres qu'il a écrit, et il est un Seigneur qui a beaucoup de mérite et de talent. On dit qu'il a refusé autrefois d'être Cardinal.* Il s'est adressé à

¹ Conti was a great favourite of the King, who had invited him to Hanover, and with whom he dined every day.

* This would recommend Orsi to Newton

moi pour vous prier de cette grace, et je le fais volontiers, car je connois les mœurs et le sçavoir de M. le Marquis;Orsi.

“ Si il y aura quelque chose de nouveau touchant l’affaire de M. Leibnitz je vous en informerai avec toute l’exactitude. Il n’y a peut-être un personne plus intéressé pour votre gloire que moy. J’en ay l’obligation, et même l’inclination. Je suis avec tout la zèle, et en vous priant de faire mes compliments à Madame votre nièce,

“ Monsieur,

Votre très-semble et tres obéissant serviteur,

“ CONTI.”

No. II.

(Referred to in pages 27, 42.)

M. Pierre Remond de Montmort, to whom Bernoulli addressed the letter mentioned in the text, was born in Paris on the 27th October 1678. He came to London in 1700, when he made the acquaintance of Newton. He visited Dr. Gregory at Oxford, who showed him his Commentary on the *Principia*, and who afterwards told him in the course of their correspondence, that he was preparing a new edition of the *Principia* under Sir Isaac’s eye, a task which he did not live to execute. This fact is mentioned in a short letter to Sir Isaac himself,¹ in which he begs his acceptance of his newly published work *Essai d’Analyse sur les Jeux de Hazard*, and expresses his sorrow for the death of Gregory. In 1704, he purchased the estate of Montmort, close to the residence of the Duchess d’Angoulême, whose niece and god-daughter, Mademoiselle de Romicourt, he married. He corresponded with Leibnitz, the Bernoullis, and other distinguished mathematicians, both in England and on the Continent, by whom he was much esteemed, both as a geometer and a member of society. He was particularly attached to our countryman Brook Taylor, by whom several of his letters have been preserved. He paid a second visit to England in 1715, and was a great admirer, as we shall afterwards see, of the beauty and accomplishments of Miss Catherine Barton, Sir Isaac Newton’s niece. He was elected in 1716 one of the *Académiciens Libres* of the Academy of Sciences. When on a visit to Paris in 1719, he was seized with small-pox, and died on the 7th October 1719, deeply lamented by the population of the three parishes which belonged to him.

The history of the very interesting letter from Bernoulli which forms this Appendix, is curious, and is given by Montmort himself in a long letter to Newton, written in bad English, and dated March 27, 1718. It contains messages from the two Bernoullis, together with an extract of Nicolas Bernoulli’s paper on Trajectories,² and a part of the following letter which he did not know had been previously in the hands of Newton.

¹ Dated Paris, 16th February 1799.

² See page 30.

When Bernoulli had learned that Newton did not approve of the challenge made to the English mathematicians, he communicated "the whole story of that affair" to Montmort, and desired him to send to Newton an extract of his letter. Montmort, lest he should annoy Newton by "giving him the trouble of an answer," sent the extract to Brook Taylor, and never learned from him that it had been forwarded to its destination. The following is the extract found among Sir Isaac's papers :—

LETTER FROM JOHN BERNOULLI TO M. REMOND DE MONTMORT.

"Avril 8, 1717.

"Je vous proteste, Mons. que je n'ai jamais eu la pensée de me commettre avec Messieurs les Anglois, ni d'entrer en lice, quand même quelqu'un d'eux m'attaqueroit, bien loin de les défier le premier; le temp et le repos me sont trop précieux pour les consumer en vaines disputes; mais voici, ce qui c'est. Mons. Leibnitz m'ayant demandé si je ne pouvois pas luy fournir quelque problème pour le proposer à Messieurs les Anglois et en particulier à M. Keil pour la solution duquel seroit requise une adresse particulière dont on ne put s'aviser aisément sans la connoissance de quelques unes des méthodes que nous avons trouvées dans le temps que j'étois encore en Hollande et que M. Leibnitz ne trouvoit pas apropos d'en faire part encore au public, me priant pour cela de menager le secret afin de s'en servir un jour utilement contre ceux qui voudroient nous braver, comme il arrive aujourd'hui. Pour faire donc plaisir à Monsr. de Leibnitz, j'ay imaginé un problème qui me paroissoit avoir les qualités telles qu'il pouvoit souhaiter. Je luy en fis part avec une double solution, afin qu'il pût, s'il le jugeoit apropos, le proposer aux Anglois mais sous son nom. J'ay sujet d'être étonné de voir que M. Leibnitz m'ait produit comme auteur, et proposant de ce problème, et cela malgré moy et même à mon insçu. Vous aurez donc la bonté de désabuser Mr. Newton de l'opinion où il est à cet égard; et de l'assurer de ma part que je n'ai jamais eu le dessein de tenter messieurs les Anglois par ces sortes de défis, et que je ne désire rien tant que de vivre en bonne amitié avec luy, et de trouver l'occasion de luy faire voir combien j'estime son rare mérite, en effect je ne parle jamais de luy qu'avec beaucoup d'éloges. Il seroit pourtant à souhaiter qu'il voulût bien prendre la peine d'inspirer à son ami Mr. Keill des sentiments de douceur et d'équité envers les étrangers, pour laisser chacun en possession de ce que luy appartient de droit, et à juste titre, car de vouloir nous exclure de toute prétention, ce seroit une injustice criante. Voicy cependant le problème dans les propres termes que je l'ay communiqué à Mons. Leibnitz, puisque vous temoignez le désirer."

BERNOULLI'S PROBLEM.

"Super Recta AG tanquam Axe ex puncto A, educere infinitas curvas, qualis est ABD, ejus naturæ ut radii osculi in singulis punctis B et ubique ducti BO secantur ab axe AG in C in data ratione, ut nempe sit BO : BC ::

: n. Deinde construendæ sunt Trajectoriæ EBF primas curvas ABD normaliter secantes."

In his correspondence with Montmort, Bernoulli expressed the greatest anxiety to be on good terms with Newton. In a letter dated March 17, 1718, he desires to know if Montmort has sent the preceding extract to Newton, and implores him again to disabuse the English of the false opinion that he and his nephew have any design of entering into disputes with them, or diminishing the value of Newton's discoveries; and he asks him, as a special favour, to do this in reference to Mr. Newton, whose esteem and friendship are very precious to him.

Montmort, in reply to this letter, stated that these expressions in reference to Newton and the English would not be considered very compatible with the *Epistola pro eminentè Mathematico*, which he had inserted in the Acts of Leipsic, and he gave him very frankly his opinion of that letter. Bernoulli replied to this letter in the following words, which Montmort sent to Newton:—

“Je ne m'en suis mêlé en aucun façon, ni de la forme que mon ami vouloit donner à la réponse, ni des expressions dont il se serviroit, et que je n'approuve pas toutes Il m'a qualifié de titres que je n'ai jamais eu la vanité d'ambitionner. Avec cela il a parlé de M. Keill d'une manier qui ne peut qu'aigrir son esprit. Cela ne me plaisoit pas. J'aurois souhaité que mon apologiste eust dit les choses simplement et nettement sans toucher sur personalités. Certes que je luy aurois recommandé avec empressement s'il m'avoit communiqué son dessein, lorsqu'il m'offrit par une lettre obligeante de vouloir défendre ma cause contre M. Keill me priant seulement de luy envoyer les preuves authentiques lesquels je ne pouvois pas luy refuser.”

Fontenelle justly remarks, in his Eloge on Montmort, that though he was more connected with the English than with the Germans by personal acquaintance, yet he was perfectly neutral between the rival analysts, always speaking the truth to both parties, and in a tone which made truth acceptable. See p. 212, and APPENDIX, No. XVII.

While this correspondence was going on, Varignon had been endeavouring to effect a reconciliation between Newton and Bernoulli. See p. 227, and APPENDIX, No. XIX.

No. III.

(Referred to in pages 36, 40.)

In the 24th Chapter of this Volume, the reader will find some account of James Wilson, M.D., the editor of Robins' *Mathematical Tracts*, the friend of Pemberton, and the editor of his *Course of Chemistry*.

1.—LETTER FROM A. B. [JAMES WILSON, M.D.] TO SIR ISAAC NEWTON.

“LONDON, December 15, 1720.

“SIR,

“I saw the other day, in the hands of a certain person, several mathematical papers, which, he told me, were transcribed from your manuscripts. They chiefly related to the doctrine of series and fluxions, and seemed to be taken out of the Treatises you wrote on those subjects in the years 1666 and 1671. I was not permitted to peruse them thoroughly, but one of the papers I particularly took notice of, and it contained a deduction of your Binomial Theorem from a corollary in your Quadratures, with some improvement, as a series for the rectangle under any two dignities of two binomials. These papers, I observed, had been very incorrectly copied, so that I endeavoured all I could to dissuade the possessor of them from getting them printed, of which nevertheless he seemed very fond. I therefore thought it behoved me to acquaint you with this matter, and, as I have not the honour to be known to you, I believed the less troublesome way to do it would be that of a letter.

“And now, Sir, permit me to say, that it is the earnest desire of everybody conversant in these subjects, that you would be pleased to publish yourself what you have formerly written; for this would effectually prevent their being ever printed incorrectly and unworthy of yourself. Nor ought you to deny that pleasure to your well-wishers and admirers, in reading your noble inventions of this kind, whereof you have expressed yourself to have been so sensible at the time you first made these discoveries. Your analysis *Per Æquationes Numero Terminorum Infinitas, Quadraturas, &c.*, give us so exquisite a delight, that when we read your letters to Mr. Oldenburgh, and your remarks on Leibnitz's reply to your letter to the Abbot Conti, we glow, as it were, with a desire of seeing all that you wrote on these subjects in 1671, and the years preceding. I have heard, indeed, that you were prevented from publishing one Treatise, by reason it had in it the Determination of the Radius of Curvity, which Huygens published afterwards in his *Horologium*. But this objection can now be of no force, since the world has been lately informed by your letter written to Mr. Collins in 1672, Decemb. 10, that you had applied your method *ad resolvendum abstrusiora problematum genera de curvitatibus, &c.*, long before the publication of Huygens's book. Nor indeed was this unknown to Apollonius in respect to the Conick Sections, as appears from his Fifth Book. It was a very great satisfaction to your countrymen and friends to observe, that by the happy discovery of Mr. Collins's papers, you had an opportunity of triumphing over such disingenuous persons, who laboured all they were able to defraud you of the honour of some of your inventions. But such is the force of prejudice on some minds, that

you cannot but observe that there are in the world dishonest men, who, contrary to their own conscience and knowledge, still raise a clamour on this head. To shame, therefore, such obstinate people, to make your right to those inventions evident to all, even the least knowing in these matters, and to put an end for ever to all disputes, the best method would be to publish all that you have formerly written on this subject, whereby we should have an exact and adequate notion of fluxions and their uses, which cannot be had from what has been delivered by others. But as they produced these things abroad first, those that are learners have recourse to their writings, and consequently mention them as the authors thereof. This has happened through your own backwardness in giving to the world what you had discovered so long ago. However, there is still a way left to retrieve all; for, as their pretended methods are grounded on the notion of indivisibles, so they have given a wrong idea of what you alone had found out, and have erred egregiously, when they even attempted to apply Second, &c., Differences, as they call 'em, to mathematical figures. This, tho' they cannot but be now at length very sensible of, yet by their cavils they would dissemble their being conscious of their errors. But these would be so apparent to every eye, if you would publish all your papers, that those who had a mind to be rightly instructed in these matters, would have recourse alone to your immortal writings; so that all succeeding mathematicians would constantly mention with honour the Series, Fluxions, &c., of the great Newton, when the differentials and integrals of Leibnitz and Bernoulli shall be quite forgotten.

“ I am, your most obedient and most humble servant, A. B.”

“ P.S.—I had just the liberty to transcribe the Theorem I mentioned at the beginning of my letter, and it was this:—

$$\begin{aligned}
 \overline{P + PQ} \overline{\lambda \times M + MN} \overline{\mu} &= P \lambda M \mu \\
 &+ \frac{\lambda \times Q}{\mu \times N} \text{A} \\
 &\frac{1}{\frac{\lambda - 1 \times Q}{\mu - 1 \times N} \text{B} + \overline{\lambda + \mu} \times N \text{QA}} \\
 &+ \frac{2}{\frac{\lambda - 2 \times Q}{\mu - 2 \times N} \text{C} + \overline{\lambda + \mu - 1} \times N \text{QB}} \\
 &+ \frac{3}{\frac{\lambda - 3 \times Q}{\mu - 3 \times N} \text{D} + \overline{\lambda + \mu - 2} \times N \text{QC}} \text{etc.} \\
 &4
 \end{aligned}$$

“ Amongst the papers I likewise observed that there were some which deduced even the first principles of geometry from the fluxions of points, &c.

“ I have since met with another person, who told me he had likewise a copy of your manuscripts. But he would not let me see them, or inform me how he came by them. I imagine, when you sent any of your friends your papers, the person they got to transcribe them took a double copy, which is a frequent practice, in order to make profit by it; so that they are in different hands. To prevent these things being ever published incorrectly, the only way is to let them come abroad yourself; for to declare that such papers as shall be published without your knowledge or consent, are imperfect and faulty, will not be sufficient to deter some bookseller or another from adventuring on the printing them for the hopes of gain. Nor need the publishing them be any trouble to you; for any of your friends would gladly undergo the labour of seeing them correctly printed.

“ In the introduction to your Quadratures, you have given us an exact idea of fluxions, but it is too short, and does not instruct us how the superior fluxions are represented by Lines. The truth is, the trifling objections that are made by your antagonists would never have been raised, if you had given us your papers, where your fluxions are illustrated by various examples. And is not this a pity, since you have pleased to permit the publication of your illustrating the common algebra. Nothing less than this can make all foreigners and prejudiced persons acquiesce, and at length to acknowledge you to be the inventor of a method that is so admirably suited both to the investigating and demonstrating the most difficult mathematical truths.”

2.—LETTER FROM JAMES WILSON, M.D., TO SIR ISAAC NEWTON.

“ LONDON, 21st January 1720-21.

“ SIR,

“ As some time ago I presumed to let you know that I had seen copies of several of your manuscripts, and having since been permitted to transcribe some of them, I take the liberty to send them to you, that you may compare them with the originals, to see after what manner they have been copied. They contain three problems, which I take to be the 2d, 3d, and 4th of your Treatise wrote in 1671. Here is also a paper in English containing five problems, which I guess to be part of that which you have mentioned in your remarks on Leibnitz's letter to the Abbot Conti, as dated 13th November 1665. The other papers seemed to have not been so well copied as these, so I did not write them out. They contained, I observed, several problems, as to find the curvature and areas of curves, and to compare curves together, &c. There was also a paper containing six examples, showing how to deduce the areas of curves from the tables in your Quadratures, with Constructions and Synthetick Demonstrations. It concluded with saying, that it was here judged proper to demonstrate by the means of moments, as it had an analogy to what the ancients have done on the like occasions. I have been likewise told by one that he had a copy of a manuscript of yours, entitled *Geometria Analytica*, which he highly prized, but this I never saw.

“When I had the honour of seeing you at Mr. Innys’s shop, you was pleased to object against publishing these manuscripts; that you apprehended it would occasion disputes concerning their antiquity. The followers of Leibnitz are, it is true, an obstinate sort of people, and no proof, however clear, seems sufficient to make them lay aside their prejudices, yet on such an occasion I cannot think they should be more than ordinarily exasperated; for thereby you will not do more than by what you have said, when you published your Quadratures, and in your remarks on Leibnitz’s reply to your letter to the Abbot Conti. The publishing indeed of the *Commercium Epistolicum* raised their fury, because that not only proved you to be the inventor of fluxions, but moreover made it appear that their master was a plagiary. However, notwithstanding this, the defamatory writings they spread abroad on that occasion were without a name, as if they were ashamed of them; and the person who has been charged as the author of them has since thought fit to deny it. But suppose this should raise ever so great a clamour, I cannot see that you need be concerned the least about it, for, in publishing these papers, you would not pretend to vindicate to yourself the right to these inventions from their antiquity; for that you rely on the arguments that are drawn from the papers contained in the *Commercium Epistolicum*, which the Leibnicians themselves do not pretend to say, are not of an older date than their master’s letter of June 21, 1677.

“But then I think these papers ought to be published on many accounts. By that means young mathematicians will be able readily to perceive the force of the arguments contained in the *Commercium Epistolicum*, and in its admirable abridgment, before they receive the least prejudice from the cavils of your antagonists. These, I think, are now all reduced to this, that it does not appear from the *Commercium* that you were acquainted with the true characteristic and algorithm of fluxions or differences before their master. The weakness of this cavil would appear evident even to the most prejudiced, if you would publish all your papers. Again, your Book of Quadratures, which all intelligent persons must own is the perfectest piece that ever saw the light, seems not to be well understood by foreigners (and perhaps not by some at home); for otherwise a certain confident person durst not lay claim to many things contained in it, under the notion of his integral calculus. But the publishing your papers would enable all to see the beauties of that noble Treatise; and this is now absolutely necessary, since there are pretenders in the world to these inventions. Lastly, as various copies of your manuscripts, more or less imperfect, are got abroad, nothing but causing them to be printed yourself can prevent their coming out incorrect and mangled, which ought not to be the fate of such excellent things.

“I am, Sir, with the profoundest respect,

“You most obedient and most humble servant,

“JAMES WILSON.

“P.S.—I humbly desire that, when you have perused these papers, you would be pleased to seal them up, and to leave them with your servants, that I may have them again upon calling for them some time or other.

“At page 48 of the *Commercium Epistolicum*, it is said by Mr. Collins, that the doctrine of Series, &c., was the subject of your lectures at Cam-

bridge, and that these lectures were reserved there, which, if so, they might afford convincing proofs of your right to these inventions.

“In your remarks on Leibnitz’s reply to your letter to the Abbot Conti, I think you seem too readily to acknowledge that Leibnitz might have found out by himself your method of an arbitrary series; for in a Scholium of your *Principia*, you say that one of the things which you concealed under a cypher, in your letter of October 24, 1676, was ‘Data *Æquatione* quocunque *Fluentes* quantitates involvente, *Fluxiones* invenire, et vice versa.’ Now, might not Leibnitz by that means be helped to decypher what was besides concealed in that letter? Amongst which was that very method of assuming a series, which he did not publish till some years after you had helped him to a key in the Scholium above-mentioned.

“I hope you will pardon this freedom, for it is not my purpose to go on in troubling you thus with impertinent letters.

“Sir, I am your most obedient

“And most humble servant,

“JAMES WILSON.”

No. IV.

(Referred to in page 58.)

LETTER FROM SIR ISAAC NEWTON TO DR. THOS. BURNET.

“SIR,

“Your argument, p. 118, I acknowledge good against those who suppose only hills and mountains taken out of y^e sea, and it may be good ag^t those who suppose all y^e earth higher than y^e sea taken out thence, but one who would have mountains and y^e sea made by removing earth from one place to another, might suppose (if it were necessary) all the earth a quarter of a mile or half a mile lower than the top of the seas, or then the lowest valleys, or even lower than that, was thrown out of y^e deep. But the opinion being to me absurd, I say no more of it. I could wish I was as well satisfied with your argument about y^e oval figure of y^e earth, for it seems hard to me that a constant force applied to stretch a membrane (as you figuratively term y^e atmosphere) should make it shrink, unless you suppose it at first overstretched by a tumultuary force, and so to return by way of undulation, and that the limus of y^e earth hardened while it was at y^e ebb. But whatever may be y^e reason of the earth’s figure, you desire my opinion what that figure is. I am most inclined to believe it spherical, or not much oval; and my chief reason for that opinion is y^e analogy of y^e planets. They all appear round so far as we can discern by telescopes, and I take y^e earth to be like y^e rest. If its diurnal motion would make it oval, that of Jupiter would much more make Jupiter oval, the *vis centrifuga* at his equator, caused by his diurnal motion being 20 or 30 times greater than the *vis centrifuga* at y^e equator, caused by the diurnal motion of y^e earth, as may be collected from the largeness of his body and swiftness of his revolutions. The sun also has a motion about his axis, and yet is round.

What may be argued from y^e dimensions of y^e earth's shaddow collected by lunar eclipses I cannot tell, nor what from y^e measures on y^e earth answering to a degree in several latitudes, not knowing how exactly those measures were made or the latitudes of places taken.

“ You seem to apprehend that I would have the present face of the earth formed in y^e first creation. A sea I believe was then formed, as Moses expresses, but not like y^e sea, but with an eaven bottom without any precipices or steep descents, as I think I exprest in my letter. Of o^r present sea, rocks, mountains, &c., I think you have given the most plausible account. And yet if one would go about to explain it otherwise, philosophically, he might say that as saltpetre dissolved in water, though y^e solution be uniform, crystallizes not all over y^e vessel alike, but here and there in long barrs of salt; so the limus of y^e chaos, or some substances in it, might coagulate at first, not all over y^e earth alike, but here and there in veins or beds of divers sorts of stones and minerals. That in other places w^{ch} remained yet soft, the air w^{ch} in some measure subsided out of the superior regions of y^e chaos, together wth y^e earth or limus by degrees extricating itself gave liberty to the limus to shrink and subside, and leave the first coagulated places standing up like hills; which subsiding would be increased by the draining and drying of that limus. That the veins and tracts of limus in the bowels of those mountains also drying and consequently shrinking, crackt and left many cavities, some dry, others filled with water. That after the upper crust of the earth by the heat of the sun, together with that caus'd by action of minerals had hardened and set; the earth in the lower regions still going closer together left large caverns between it, and the upper crust filled with y^e water, w^{ch} upon subsiding by its weight, it spread out by degrees till it had done shrinking, which caverns or subterranean seas might be the great deep of Moses, and if you will, it may be supposed one great orb of water between y^e upper crust or gyrus and the lower earth, though perhaps not a very regular one. That in process of time many exhalations were gather'd in those caverns which would have expanded themselves into 40 or 50 times the room they lay in, or more, had they been at liberty. For if air in a glass may be crowded into 18 or 20 times less room than it takes at liberty, and yet not burst the glass, much more may subterranean exhalations by the vast weight of y^e incumbent earth be kept crowded into a less room before they can in any place lift up and burst that crust of earth. That at length somewhere forcing a breach, they by expanding themselves, forced out vast quantities of water before they could all get out themselves, w^{ch} commotion caused tempests in y^e air, and thereby great falls of rain in spouts, and all together made y^e flood, and after the vapours were out, y^e waters retired into their former place. That the air w^{ch} in y^e beginning subsided with y^e earth, by degrees extricating itself, might be pent up in one or more great caverns in the lower earth under y^e abyss, and at y^e time of y^e flood, breaking out into y^e abyss, and consequently expanding itself, might also force out y^e waters of y^e abyss before it. That the upper crust or gyrus of earth might be upon the stretch before y^e breaking out of y^e abyss, and then by its weight shrinking to its natural posture, might help much to force out the waters. That the subterranean vapors which then first break out and have ever since continued to do so, being found by experience noxious to man's health, infect the air and cause that shortness of life w^{ch} has been ever since the

flood. And that several pieces of earth either at y^e flood or since falling, some perhaps into y^e great deep, others into less and shallower cavities, have caused many of those phenomena we see on y^e earth, besides the original hills and cavities.

“But you will ask how could an uniform chaos coagulate at first irregularly in heterogeneous veins or masses to cause hills. Tell me then how an uniform solution of saltpetre coagulates irregularly into long bars; or to give you another instance, if tinn (such as the pewterers bring from y^e mines in Cornwel to make pewter of) be melted and then let stand to cool till it begin to congeal, and when it begins to congeale at y^e edges, if it be inclined on one side for y^e more fluid part of y^e tin to run from those parts w^{ch} coagulate first, you will see a good part of y^e tin congealed in lumps which after the fluid part of y^e tin which congeals not so soon is run from between them, appear like so many hills, with as much irregularity as any hills on y^e earth do. Tell me y^e cause of this, and y^e answer will perhaps serve for the chaos.

“All this I write not to oppose you, for I think the main part of your hypothesis as probable as that I have here written, if not in some respects more probable. And tho’ the pressure of y^e moon or vortex, &c., may promote y^e irregularity of y^e causes of hills, yet I did not in my former letter design to explain the generation of hills thereby, but only to insinuate how a sea might be made above ground in your own hypothesis before the flood, besides the subterranean great deep, and thereby all difficulty of explaining rivers, and the main point in w^{ch} some may think you and Moses disagree might be avoyded. But this sea I not [do] not suppose round the equator, but rather to be two seas in two opposite parts of it where the cause of y^e flux and reflux of or present sea deprest y^e soft mass of y^e earth at that time when y^e upper crust of it hardened.

“As to Moses, I do not think his description of y^e creation either philosophical or feigned, but that he described realities in a language artificially adapted to y^e sense of y^e vulgar. Thus when he speaks of two great lights, I suppose he means their apparent not real greatness. So when he tells us God placed these lights in y^e firmament, he speaks I suppose of their apparent not real place, his business being not to correct the vulgar notions in matters philosophical, but to adapt a description of the creation as handsomely as he could to y^e sense and capacity of y^e vulgar. So when he tells us of two great lights, and y^e stars made y^e 4th day, I do not think their creation from beginning to end was done the 4th day, nor in any one day of y^e creation, nor that Moses mentions their creation, as they were physical bodies in themselves, some of them greater than this earth, and perhaps habitable worlds, but only as they were lights to this earth, so therefore though their creation could not physically [be] assigned to any one day, yet being a part of y^e sensible creation which it was Moses’s design to describe, and it being his design to describe things in order according to the succession of days, allotting no more than one day to one thing, they were to be referred to some day or other, and rather to the 4th day than any other, if they [the] air then first became clear enough for them to shine thro’ it, and so put on y^e appearance of lights in y^e firmament to enlighten the earth. For till then they could not properly be described under y^e notion of such lights, nor was their description under that notion to be deferred after they had that appearance, tho’ it may be the creation

of some of them was not yet completed. Thus far, perhaps, one might be allowed to go in y^e explaining y^e creation of y^e 4th day, but in y^e third day for Moses to describe y^e creation of seas when there was no such thing done neither in reality nor appearance, me thinks is something hard, and that y^e rather becaus if before y^e flood there was no water but that of rivers, that is, none but fresh water above ground, there could be no fish but such as live in fresh water, and so one half of y^e fift day's work will be a non entity, and God must be put upon a creation after y^e flood, to replenish one half of this terraqueous globe wth whales, and all those other kinds of sea fish we now have.

“You ask what was that light created the first day? Of what extent was the Mosaical chaos? Was y^e firmament, if taken for y^e atmosphere so considerable a thing as to take up one day's work? and would not y^e description of y^e creation have been complete without mentioning it? To answer these things fully, would require comment upon Moses whom I dare not pretend to understand: yet to say something by way of conjecture, one may suppose that all y^e planets about or sun were created together, there being in no history any mention of new ones appearing or old ones ceasing. That they all, and y^e sun too, had at first one common chaos. That this chaos, by y^e spirit of God moving upon it, became separated into several parcels, each parcel for a planet. That at y^e same time y^e matter of y^e sun also separated from the rest, and upon y^e separation began to shine before it was formed into that compact and well defined body we now see it. And the preceding darkness and light now cast upon y^e chaos of every planet from the solar chaos, was the evening and morning, w^{ch} Moses calls y^e first day, even before y^e earth had any diurnall motion, or was formed into a globular body. That it being Moses design to describe the origination of this earth only, and to touch upon other things only so far as they related to it, he passes over the division of y^e general chaos into particular ones, and does not so much as describe y^e fountain of that light God made, that is, y^e chaos of y^e sun, but only wth respect to the chaos of the earth, tells us that God made light upon the face of y^e deep where darkness was before. Further, one might suppose that after y^e chaos was separated from y^e rest, by y^e same principle w^{ch} promoted its separation (w^{ch} might be gravitation towards a centre), it shrunk closer together, and at length a great part of it condensing, subsided in y^e form of a muddy water or limus, to compose this terraqueous globe. The rest w^{ch} condensed not, separated into two parts, the vapors above and the air, w^{ch} being of a middle degree of gravity ascended from y^e one, descended from y^e other, and gathered into a body stagnating between both. Thus was the chaos at once separated into three regions, the globe of muddy waters below y^e firmament, the vapors or waters above the firmament, and y^e air or firmament itself. Moses had before called the chaos *the deep* and *the waters*, on y^e face of w^{ch} y^e spirit of God moved, and here he teaches the division of all those waters into two parts, with a firmament between them: w^{ch} being the main step in y^e generation of this earth, was in no wise to be omitted by Moses. After this general division of y^e chaos, Moses teaches a subdivision of one of its parts, that is, of the miry waters under y^e firmament into clear water, and dry land on the surface of the whole globous mass, for w^{ch} separation nothing more was requisite then that y^e water should be drained from y^e higher parts of y^e limus to leave

them dry land, and gather together into y^e lower to compose seas. And some parts might be made higher than others, not only by y^e cause of y^e flux and reflux, but also by y^e figure of y^e chaos, if it was made by division from y^e chaos of other planets, for then it could not be spherical. And now while the new planted vegetables grew to be food for animals, the heavens becoming clear, for y^e Sun in y^e day, and Moon and stars in y^e night, to shine distinctly through them on the earth, and so put on y^e form of lights in y^e firmament, so that had men been now living on y^e earth to view the process of y^e creation, they would have judged those lights created at this time. Moses here sets down their creation as if he had then lived, and were now describing what he saw. Omit them he could not, without rendering his description of the creation imperfect in y^e judgment of y^e vulgar. To describe them distinctly as they were in themselves, would have made y^e narration tedious and confused, amused y^e vulgar, and become a philosopher more then a prophet. He mentions them, therefore, only so far as y^e vulgar had a notion of them, that is, as they were phenomena in y^e firmament; and describes their making only so far, and at such a time, as they were made such phenomena. Consider, therefore, whether any one who understood the process of y^e creation, and designed to accommodate to y^e vulgar not an ideal or poetical, but a true description of it as succinctly and theologically as Moses has done, without omitting any thing material w^{ch} y^e vulgar have a notion of, or describing any being further then the vulgar have a notion of it, could mend that description w^{ch} Moses has given us. If it be said that y^e expression of making and setting two great lights in y^e firmament is more poetical then natural, so also are some other expressions of Moses, as when he tells us the windows or floodgates of heaven were opened (Gen. vii.), and afterwards stopped again (Gen. viii.); and yet the things signified by such figurative expressions are not ideall or moral, but true. For Moses, accommodating his words to y^e gross conceptions of y^e vulgar, describes things much after y^e manner as one of y^e vulgar would have been inclined to do had he lived and seen y^e whole series of what Moses describes.

“Now for the number and length of y^e six days: By what is said above, you may make the first day as long as you please, and y^e second day too, if there was no diurnal motion till there was a terraqueous globe,—that is, till towards y^e end of that day’s work. And then if you will suppose y^e earth put in motion by an eaven force applied to it, and that y^e first revolution was done in one of our years, in the time of another year there would be three revolutions, of a third five, of a fourth seaven, &c., and of y^e 183d year, 365 revolutions, that is, as many as there are days in our year,—and, in all this time, Adam’s life would be increased but about 90 of o^r years, w^{ch} is no such great business. But yet I must profess I know no sufficient naturall cause of y^e earth’s diurnal motion. Where natural causes are at hand, God uses them as instruments in his works, but I doe not think them alone sufficient for y^e creation, and therefore may be allowed to suppose that, amongst other things, God gave the earth its motion by such degrees, and at such times, as was most suitable to y^e creatures. If you would have a year for each day’s work, you may, by supposing day and night was made by the annual motion of the earth only, and that the earth had no diurnal motion till towards the end of y^e six days. But you’ll complain of long and dolefull nights; and why might

not birds and fishes endure one long night as well as those and other animals endure many in Greenland; or rather why not better then the tender substances w^{ch} were growing into animals might endure successions of short days and nights, and consequently of heat and cold? For what think you would become of an egge or embryo w^{ch} should frequently grow hot and cold? Yet if you think y^e night too long, its but supposing the Divine operations quicker. But be it as it will; me thinks one of the Tenn Commandm^{ts} given by God in Mount Sina, prest by divers of y^e prophets, observed by o^r Saviour, his Apostles, and first Christians for 300 years, and with a day's alteration by all Christians to this day, should not be grounded on a fiction. At least divines will hardly be persuaded to [be]lieve so.

“As I am writing, another illustration of y^e generation of hills, proposed above, comes into my mind. Milk is as uniform a liquor as the chaos was. If beer be poured into it, and y^e mixture let stand till it be dry, the surface of y^e curdled substance will appear as rugged and mountainous as the earth in any place. I forbear to describe other causes of mountains, as the breaking out of vapours from below before the earth was well hardened,—the settling and shrinking of y^e whole globe after y^e upper regions or surface began to be hard. Nor will I urge their antiquity out of Prov. viii. 25, Job xv. 7, Psalm xc. 2, but rather beg yo^r excuse for this tedious letter, which I have y^e more reason to do, because I have not set down anything I have well considered, or will undertake to defend.”

There is no signature to this letter, but the whole is distinctly written in Sir Isaac's hand, and almost without any corrections or interlineations, which is very unusual in his manuscripts.

PART OF A LETTER FROM SIR ISAAC NEWTON ON FLAMSTEED'S SPECULATIONS RESPECTING THE SUN, THE ACTION OF HEATED MAGNETS, AND THE MOTION OF COMETS.

Concerning the experiment that a magnet loses its magnetism by heat, some have indeed supposed the sun to be cold, but I believe Mr. Flamsteed is not of this opinion, for they may as well affirm culinary fire to be cold. For we have no argument of its being not, but that it heats and burns things that approach it, and we have the same argument of the sun being hot. Were we ten times nearer him, no doubt we should feel him an hundred times hotter, for his light would be there an hundred times more constipated, and the experiment of the burning glass shows that his heat is answerable to the constipation of his light. So then were a body hard by the sun, his light being there about 50,000 times more constipated, his heat would be 50,000 times greater than we feel it in a hot summer day,

which is vastly greater than any heat we know on earth. Now, though the inward part of the sun were an earthly gross substance, yet if the liquid shining substance which Mr. Flamsteed supposes to swim upon it, be then hot, it will heat the matter within as certainly as melted lead would heat an iron bullet immersed in it. Nor is it material whether the liquid matter on the sun be of any considerable thickness. An iron bullet would heat as fast in a quart as in an ocean of melted lead, this difference only excepted, that the bullet would cool a small quantity of lead more than a great one. If then the liquid matter swimming on the sun be but so thick as not to be cooled by the central parts (as it must be), it will certainly heat the central parts, for it imparts heat to the contiguous matter as fast as if it were thicker, and keeps of all cool environing mediums (the instrument of cooling things), from coming near the central parts to cool them. By which means the central parts must become as hot, as if the hot fluid matter surrounding it equalled the whole vortex. The whole body of the sun, therefore, must be red hot, and consequently void of magnetism, unless we suppose its magnetism of another kind from any we have, which Mr. Flamsteed seems inclinable to suppose.

As for a great magnet exercising its directive virtue more strongly than its attractive on a small one, it holds in all cases I had opportunity to observe, and till a contrary instance can be brought, I am inclined to believe it holds generally. Mr. Flamsteed puts a case of a little magnet thrown violently by a great one. In this case, certainly, the motion of the small magnet neither helps nor hinders any part of the operation of the great magnet upon it, only that it shortens the time the great magnet has to operate in. Were the great magnet thrown along by the side of the little one, that it might have time enough to work on it, no doubt it would direct it as well as attract it. For do not magnets thus operate when trajected through the air in a ship under sail, more swiftly about the centre of the earth by the diurnal motion thereof, still more swiftly about the sun by the annual motion! And were the greater of the two magnets stopped, would it operate otherwise? Surely not. It would only want time to operate in. And if for want of time it directed not, much less would it attract or repel. If an instance could be found where a projected magnet is attracted or repelled by a fixed one, but not directed, it would be material. But such an instance, I doubt, will scarce be found. But if for want of time to perform the magnetical operations in, it be neither sensibly attracted, repelled, nor directed, it is nothing to the purpose. On the other hand, I add, that a resting magnet, if it have a large sphere of activity, so that it may have time to perform its operations before the projectile magnet be out of its reach, it will direct more strongly than attract, and I give this instance of it. Let the earth represent the great resting magnet, the mariner's needle a small one: this is directed as strongly by the earth when the ship is in its swiftest motion under sail, as when it rests, so far as observations have hitherto been made, and consequently were the ship ten times swifter, would still be as much directed, and yet so little attracted by the earth as not to become sensibly heavier thereby. The case is the same with a comet continuing long within the reach of the sun's magnetism.

The instance of a bullet shot out of a cannon, and keeping the same side forward, may be a tradition of the gunners, but I do not see how it

can consist with the laws of motion, and therefore dare venture to say that upon a fair trial it will not succeed, excepting sometimes by accident. The trial may be thus made upon a spell or bridge such as school-boys play with: lay a large ball, one hemisphere of which is white, the other black. Either hemisphere lying upwards, strike the edge of the bridge to make the ball rise, and if the ball receive not any circulating motion from the stroke, you will see the hemisphere which is laid upwards continue upwards as well falling as rising. If I did not know the event of the experiment by the reason of it, yet I could guess at it by what I have observed of a hand-ball tossed up.

To the foregoing objections may be added this:—If the comet be attracted in its access to the sun, and repelled in its recess, and so being continually accelerated would be swifter in its recess than in its access, contrary to what Mr. Flamsteed and others believe. For the magnetic repulse continually urging the comet to the sun, would make it go away faster and faster continually.

Another objection may be this:—Let s be the sun, $ABCD$ the line of the

comet's motion, according to the hypothesis, ABC that part in which the comet is attracted, CDF that part in which it is repelled. When the comet comes at C , being there neither attracted nor repelled, it ought to proceed on in the line of the determination of its motion CV , and verge neither to D on the one hand, nor to E on the other; but when it is advanced a little farther, and begins to be repelled, the repulse will not make it verge from the line of its motion's direction CV towards the sun, but drive it from the sun, that is it does not make it verge from CV towards D , but towards E , and so go away in the line CE . But I should have put the point where it begins to be repelled a little sooner, as at K . If to avoid this difficulty the comet be made to pass between the sun and us, that supposition is urged by the difficulty mentioned in my former letter. But all these difficulties may be avoided by supposing the comet to be directed by the sun's magnetism as well as attracted, and consequently to have been attracted

all the time of its motion, as well as in its recess from the sun, as in its access towards him, and thereby to have been as much retarded in its recess as accelerated in his access, and by this continual attraction to have been made to fetch a compass about the sun in the line $\Delta BKDF$, the *vis centrifuga* at C overpowering the attraction and forcing the comet there, notwithstanding the attraction, to begin to recede from the sun."

The date of the letter, of which this was intended to form a part, is April 16, 1681.

LETTER FROM SIR ISAAC NEWTON TO DR. COVEL.

"Sr,

"I have had an account of the solemnity of the Proclamation; and I am glad to understand it was performed wth so much decency by the wiser and more considerable part of y^e university, and generosity on yo^r part. The next thing is a book of verses. If you do it at all, y^e sooner y^e better. Concerning y^e new Oaths w^{ch} you are to administer, I need not give instructions to you about their legality. But because many persons of less understanding (whom it may be difficult to persuade) will scruple at them, I will add my thoughts to yours, that you may have the fuller argument for convincing them, if I can add anything to what you have not thought of; ffor, seeing these Oaths are the main thing that y^e dissatisfied part of y^e University scruple, I think I cannot do the University better service at present than by removing the scruples of as many as have sense enough to be convinced wth reason. The argument I lay down in the following propositions:—

"1. Fidelity and Allegiance sworn to y^e King is only such a fidelity and obedience as is due to him by y^e law of y^e land; ffor were that faith and allegiance more than what the law requires, we should swear ourselves slaves, and y^e King absolute; whereas, by the law, we are free men, notwithstanding those Oaths.

"2. When, therefore, the obligation by the law to fidelity and allegiance ceases, that by the Oath also ceases; ffor might allegiance be due by the oath to one person, whilst by the law it ceases to him and becomes due to another, the oath might oblige men to transgress the law and become rebels or traitors; whereas the oath is a part of the law, and therefore ought to be so interpreted as may consist wth it.

"Fidelity and Allegiance are due by y^e law to King William, and not to King James. For the Statute of 25 Edw. 3, w^{ch} defined all treasons against y^e King, and is y^e only statute to that purpose, by the king understands not only a king *de jure* and *de facto*, but also a king *de facto*, though not *de jure*, against whom those treasons lye. Whence the L^d Chief Justice

Hales, in his Pleas of the Crown, page 12, discoursing of that statute, tells us that a *king de facto and not de jure*, is a king within that Act, and that treason against him is punishable, tho' the right heir get the crown. And that this has been the constant sense of the law, Sr Robt. Sawyer also, upon my asking him about it, has assured me. And accordingly, by another statute in the first of Hen. 7, 'tis declared treason to be in arms against a king *de facto* (such as was Richard the Third) tho' it be in behalf of a king *de jure*. So then by y^e law of y^e land all things are treason against King William w^{ch} have been treason against former kings; and therefore the same fidelity, obedience, and allegiance w^{ch} was due to them is due to him, and by consequence may be sworn to him by y^e law of y^e land. Allegiance and protection are always mutuall; and, therefore, when K. James ceased to protect us, we ceased to owe him allegiance by y^e law of y^e land. And, when King W. began to protect us, we begun to owe allegiance to him.

"These considerations are in my opinion sufficient to remove y^e grand scruple about the oaths. If y^e dissatisfied party accuse the Convention for making y^e P. of Orange King, 'tis not my duty to judge those above me; and therefore I shall only say that, if they have done ill, 'Quod fieri non debuit, factū valet.' And those at Cambridge ought not to judge and censure their superiors, but to obey and honour them according to the law and the doctrine of passive obedience.

"Yesterday a bill for declaring the Convention a Parliament was read y^e 2^d time and committed. The Committee have not yet finished their amendments of it. There is no doubt but it will pass. I am in haste,

"Yor most humble servant,

"IS. NEWTON.

(Referred to in page 77.)

LETTER FROM JOHN LOCKE TO MR. NEWTON.

"LONDON, 26th July 1692.

"SIR,

"Finding noe better conveyance, I have sent you the 8th Chapter by Martin the carrier. It was delivered to his owne hands yesterday. I would beg y^a, if y^a have soe much leisure, to read, correct, censure, and send it back by the same hand this weeke, else I fear the presse will stay. I deferred it so long, in hopes to send all together by a safe hand, missing that I have ventured but one chapter at once. As soon as this comes back, I will send the next.

"Mr. Boyle has left to Dr. Dickson, Dr. Cox, and me, the inspection of his papers. I have here inclosed sent you the transcript of two of them that came to my hand, because I knew you desired it. Of one of them I

have sent you all there was;—of the other, only the first period, because it was all you seemed to have a minde to. If you desire the other periods, I will send you them too. If I meet with anything more concerning the process he communicated to you, you shall have it; and if there be anything more in relation to any of Mr. Boyle's papers, or anything else wherein I can serve you, be pleased to command,

“Sir,

“Your most affectionate and most humble servant,

“J. LOCKE.

“*First Period.*

“℞ ☿. ℔ x, cleanse it well with ℔ j of flowers of Δ in 24 hours. To these ℔ x, take $\bar{3}$ ij of minerel soap *u* 2, shake it with the ☿, so as it may first imbody with it, and afterwards, by further agitation, be spued out by it. This worke may last 24 hours or more. To the same ☿, adde $\bar{3}$ j more of the soape, and worke as before. This doe 7 times. Then before any Durca be added, the matter must be kept in agitation as before for at least 7 days, for 'twill be the better (if it be forced in) adding no soap to it. The soap being to make it throw out any feculency that may lie concealed in ☿ in the forme of a powder, whereby the ☿ will remain the purer.

“℞ ℔ j of choice ☿, and grind with it for 2 or 3 hours, or longer, if need be, $\bar{3}$ j of our dry soap, till it have been *aaa* with it, and thrown out again in the form of an unpromising powder. Then put to it another dram of the soap, and proceed as before. Afterwards adde a 3d dram, and set aside the powder that will be thrown out as formerly, and thus impregnate the liquor with $\bar{3}$ j after another, till you have incorporated with it, as far as you can doe it, by grinding a whole ounce.”

No. VIII.

(*Referred to in page 82.*)

LETTER FROM DR. BENTLEY TO SIR ISAAC NEWTON.

“Feb. 18, 169 $\frac{2}{3}$.”

“HON^d SIR,

“Understanding y^t the publication of my sermons might be delayed a while without any damage to y^e bookseller, I have kept them in my hands, and shall keep them a little longer. And, though there were yet several matters in them, about which I would have purchased your opinion at no small rate, nevertheless I had not presumed any further to interrupt your worthy design with questions from a stranger. But y^r unexpected and voluntary favour by the last post doth encourage me to request you, y^t you

would run over this abstract and thread of my first unpublished sermon ; and to acquaint me with what you find in it y^t is not conformable to truth and your hypothesis. My mind would be very much at ease, if I have that satisfaction, before y^e discourses are out of my power.

“ Proved, in y^e 6^{son} ‘ That y^e present system of y^e world cannot have been eternal. So y^t matter being eternal (according to y^e Atheists) all was once a chaos, y^t is, all matter was evenly or near upon evenly diffused in the mundane spaces.’

“ I proceed therefore in this 7th to show, y^t matter in such a chaos could never naturally convene into this or a like system. To which end we must consider some systematical phænomena of y^e present world. And

“ (1.) All bodies around our earth gravitate, even y^e lightest comparatively, and in their natural elements.

“ (2.) Gravity or y^e weight of bodies is proportional to y^e quantity of matter, at equal distances from y^e center.

“ (3.) Gravity is not peculiar to terrestrial bodies, but common to all y^e planets and y^e sun. Nay the whole bodies of sun and planets mutually gravitate toward one another ; and in a word ‘ all bodies gravitate toward all. This universal gravitation or attraction is y^e τὸ φαινόμενον or matter of fact, for y^e demonstration of which I must referr you to Indeed as to the cause and origin of this gravity he was pleased to determin nothing. But you will perceive in the sequel of this discourse y^t it is above all mechanism or power of inanimate matter, and must proceed from a higher principle and a divine energy and impression.’ (I have written these words at large, y^t you may see if I am tender enough, how I engage your name in this matter.)

“ (4.) Now if gravity be proportional to y^e q^{ty} of matter, there is a necessity of admitting a vacuū.

“ (5.) And to estimate w^h proportion y^e void space in our system may bear to y^e solid mass. Refined gold (though even y^t be porous, because dissoluble in ☿ and aqua regia, and y^e tanted non impossibility y^t the figures of its corpuscles should be adapted for total contact, is to common water as 19 to 1, and water to common air as 850 to 1, so y^t gold is to air as 16,150 to 1, so y^t y^e void space in the textur of coⁿ air is 16,150 times as big as y^e solid mass. And because air hath an elasticke endeavour to expand itself, and y^e space it occupes, being reciprocally as its compression, the higher it is, ’tis y^e less compressed and more rarefied, and at y^e hight of a few miles it has some million parts of void space to one of real bodie ; and at y^e hight of 1 terr. semid (as hath calculated), tis so very tenuious, y^t a sphere of our common air (already 16,150 parts nothing) expanded to y^e thinness of y^t region would more than take up y^e whole orb of Saturn, which is many million millions of times bigger than all y^e globe of y^e earth : and yet higher above y^t, y^e rarefaction gradually increases in immensum. So y^t the whole concave of y^e firmament, except sun, planets, and atmospheres may be considered as a mere void.

“ (6.) Esto hypothesis ; That every fixt starr is a sun ; so y^t the proportion of void space to matter y^t is found in our sun’s vortex will near upon hold in y^e rest of y^e mundane space. [I know what Kepler says, Epitome Astron. p. 36, therefore quæro, if this hypothesis may pass.] Allow then y^t the globe of y^e earth is entirely solid and dense, and y^t all y^e matter of

our sun, planets, atmospheres, and æther, is about 50,000 times as much as y^e bulk of y^e earth. Astronomers will bear us witness y^t we are liberal enough. Now the Orbis Magnus (7000 terr. diam. wide) is 343,000,000,000 times as big as the whole earth, and therefore is 6,860,000 times as big as all y^e matter of our system. But by the doctrine of y^e parallaxis, we cannot well allow less (in y^e Copernican hypothesis) than 100,000 diam. of y^e Orb Mag: for the diameter of y^e firmament. So y^t the whole concave of y^e firmament is (in y^e 3 plic. Prop.) 1,000,000,000,000,000 times as big as y^e sphere of y^e Orbis Magnus, and therefore (multiplying this by 6,860,000) it is 6,860,000,000,000,000,000 times as big as all y^e matter of our system. So y^t if all y^t matter was evenly disperst in y^e concave of y^e firmament, every corpuscle would have a sphere of void space around it 68,600 . . . times bigger than its own dimensions: and y^e diameter of y^e sphere would be above 19,000,000 times longer than y^e diameter of y^e corpuscle (supposing y^e corpuscle to be spherical). And further, because of y^e equal spheres of other corpuscles about y^t corpuscle, y^e void space about every corpuscle becomes twice as wide as it was, having a diam. compounded of y^e diameter of its own sphere, and y^e 2 semidiameters of y^e spheres of y^e 2 next corpuscles opposite, so y^t every atom has a void space about it 8+68,600 . . . times as big as y^e atom, and would be distant 19,000,000 times its own length (if spherical) from any other corpuscle. And by y^e same supposition of equal diffusion in y^e whole surface of y^e void sphere about every atom whose diam. is 38,000,000 times as long as y^e diam. of y^e atoms, there can be no more than 12 atoms placed at equal distances from y^e central one and from each other (like y^e center and angles of an icosaedron). So y^t lastly, every atom is not only so many million millions of times distant from any other atom, but if it should be moved and impelled (without attraction or gravitation) to y^e length of y^t distance, it is many more million millions odds to an unit, that it doth not hit and strike upon one of those 12 atoms. But y^e proportion of this void to matter within our firmament, may hold in all y^e other mundane spaces beyond it. [The measure of y^e Orbis M. 7000 terrest. diam. and of y^e firmamēt 100,000 diam. of y^e Orbis Magnus I take from And: Tacquet, being round numbers. If you substitute better instead of them, y^e calculation may be soon altered.]

“I am aware, y^t half of y^e diameter of y^e firm: should be allowed for y^e radij of y^e several vortices of y^e next fixt stars, so y^t the space of our sun's vortex should be diminished, as 8 to 1. But because y^e semr. of y^e firm. may be immensely greater thā we supposed it, we think y^t abatement not worth considering.

“(1.) Now the design of all this is to show, which (if y^e premises be granted) is evident at first sight, y^t in y^e supposition of such a chaos, no quantity of common motion (without attraction) could ever cause these stragling atoms to convene into great masses and move, as they do in our systē, a circular motion being impossible to be produced naturally, unless there be either a gravitation or want of room.

“(2.) And as for gravitation, 'tis impossible y^t that should either be co-eternal and essential to matter, or ever acquired by it. Not essential and co-eternal to matter; for then even our system would have been eternal (if gravity could form it) against our Atheists' supposition, and what we have proved in our last. For let them assign any given time, y^t matter con-

vened from a chaos into our system, they must affirm y^t before y^e given time matter gravitated eternally without convening, which is absurd. [Sir, I make account, y^t your courteous suggestion by your last, y^t a chaos is inconsistent with y^e hypothesis of innate gravity, is included in this paragraph of mine.] And again, 'tis unconceivable, y^t inanimate brute matter should (without a divine impression) operate upon and affect other matter without mutual contact; as it must, if gravitation be essential and inherent in it.

“(3.) But then if gravitation cannot be essential to matter, neither could it ever be acquired by matter. This is self-evident, if gravitation be true attraction. And if it be not true attraction, matter could never convene from a chaos into a system like ours (paragraph 1.) Nay, even now, since y^e forming of our system, gravitation is inexplicable otherwise than by attraction. 'Tis not magnetism, as you have shown. 'Tis not y^e effect of vortical motion; because it is proportional to y^e Q of matter, for if the earth was hollow, there would be no less weight of bodie in y^e air (according to vortices), than if it was solid to y^e centre: there would be no less pressure toward y^e sun, if y^e whole space of y^e sun were a mere void, than if a dense bodie. Again: A vortical motion, without gravitation antecedent to it, supposeth and requires, either an absolute full, or at least a dense texture of y^e æthereal matter, contrary to what is proved before, and what appears from y^e motions of comets: and besides, as you have shown, it contradicts y^e phænomena of y^e slower motion of planets in Aphelijs qua Perihelijs, and y^e sesquialteral proportion of y^t periodical motions to their orbs. In a word, if gravity be not attraction, it must be caused by impulse and contact; but y^t can never solve universal gravitation, in all scituations, lateral as well as descending, &c., according to y^e phænomena of your hypothesis.

“[Sir, to my conceptions, universal gravitation, according to your doctrine, is so impossible to be solved mechanically, y^t I was much surprised to see you warn me what I ascribed to you, for you pretended not to know y^e cause of it. As to innate gravity, you perceive y^t it is wholly against my purpose and argumentation. If I used y^t word, it was only for brevity's sake. But I must needs desire your judgment of w^t is here deliver'd to y^t purpose. I look't a little into Hugenius de la Pesanteur, when it newly came out, and I well remember that it cannot be reconciled to your doctrine; and Varignon's book I read, which, besides y^t it cannot explain universal gravity, is confuted by y^e most vulgar phænomena. He makes long filets of *materia subtilis* reach from y^e top of y^e earth's vortex to y^e earth. All bodies descend y^t are in y^e lower half, because y^e superior part of y^e filets are y^e longer. All ascend in y^e higher half, for y^e contrary reason. But in y^e middle of them there is a considerable space of equilibriū, indifferent both to ascent and descent, w^h he calls *espace de repose*, and in y^t y^e moon moves in a circle without ascending or descending very well. Therefore, in y^e filets of y^e Sun's vortex, all y^e space between Mercury and Saturn is an *espace de repose* a small distance for y^e equilibrium; so much longer than y^e whole half of y^e filets from Mercury to y^e body of y^e sun.]

“(4.) But though we could suppose gravitation essential to matter, or rather supervene into matter while it was diffused in a chaos, yet it could never naturally constitute a system like ours.

“(1.) For if matter be finite, and seeing extension is not matter, y^e summe

of y^e mundane matter must consist of sepearte parts divided and disterminated by vacuum; but such parts cannot be positively infinite, any more than there can be an actually and positively infinite arithmetical summe, which is a contradiction in terms. It may be said y^t all bodies have infinite *puncta*, so y^t there are infinite summs. Indeed at y^t rate all numbers are infinite, as containing infinite fractions. Even fractions themselves are infinite. But such *puncta* are not *quanta*, so y^t the case is different *toto genere*. Can a positive summe contain infinite ones, twos, or infinite *given* fractions? Can it have infinite *quota* and *quanta* as y^e atoms we speak of are? I say, then, if matter be finite, it must be in a finite space. But, then, by universal gravity, in an even diffusion, all matter would convene in one mass, in y^e middle of y^e space, and, if never so unevenly diffused, all would convene still into one mass, though not in y^e middle of y^e mundane space, but in y^e center of y^e common gravity.

“(2.) Nay, though we suppose it once constituted, even then, even now, all would convene together in a finite system. I grant, y^t if y^e whole world was but one sun, and all y^e rest planets moving about him, they would not convene; but in several fixt starrs y^t have no motion about each other, they, with their systems of planets, would all convene in y^e common center of mundane gravity, if y^e present world was not sustained by a Divine power.

“[Sir, in a finite world, where there are *outward* fixt starrs, this seems plainly necessary; but in y^e supposition of an infinite space, let me ask your opinion. I acquiesce in your authority, y^t in matter diffused in an infinite space, 'tis as hard to keep those infinite particles fixt at an equilibrium, as poise infinite needles on their points upon an infinite speculum. Instead of particles, let me assume fixt starrs, or great fixt masses of opake matter, is it not as hard y^t infinite such masses in an infinite space should maintain an equilibrium, and not convene together; so y^t, though our system was infinite, it could not be preserved but by y^e power of God.]

“(3.) Moreover, in such a chaos, though gravity should supervene to matter, y^e planets could never acquire their transverse motions about y^e sun, &c. If they were formed in y^e same orbs they now move in, they could never begin to move circularly; y^e ætherial matter could not impress it, for y^t is too thin, and is indifferent to east or west, as appears from comets. Nor could gravity act in a horizontal line, as they move in where there is no inclination nor descent. Now, therefore, suppose the planets to be formed in some higher regions, and first descend towards the sun, wherby they would acquire their velocities; but then they would have continued their descent to y^e sun unless a Divine power gave them a transverse motion against y^t vast impetus y^t such great bodies must fall with; so y^t on all accounts there's a necessity of introducing a God.

“[As to what you cite from Blondel, I have read y^e same in Hon. Fabri's *Astronomia Physica*, and Galilæo's *System*. p. 10 and 17, who adds, y^t by the velocity of Saturn, one may compute at what distance from y^e sun it was formed, according to y^e degrees of acceleration found out by himself in the progression of odd numbers. (But he must surely have erred, not knowing w^t you have since shewn, y^t y^e velocity of descent as well as weight of bodies decreases as y^e square of y^e distance increases,) and y^t there is y^t proportion of y^e distances and velocities of all y^e planets *quam proxime*, as if they all dropt from y^e same hight. (But you seem to reject this, say-

ing, y^t the gravitation of y^e sun must be doubled at y^e very moment they reach their orbs.) I confess I could make no use of y^e passage of Galilæo and Fabri, because I could not calculate, so y^t I said no more, but in general as above, and y^e rather because I knew that there must be some given hights, from whence each of them descending, might acquire their present velocities. But I own, y^t if I could understand y^e thing, it would not be only ornamental to y^e discourse, but a great improvement of y^e argument for a Divine power; for I think it more impossible y^t they should be all formed naturally at y^e same yⁿ at various distances; and 'tis y^e miracle of all miracles if they were naturally formed at such intervals of time, as all of them to arrive at their respective orbs at y^e very same moment, which is necessary, if I rightly conceive your meaning about doubling y^e sun's attraction; for if Mercury fell first, and when he reached his own orb, y^e sun's attraction was doubled. That continuing doubled, y^e descents of y^e succeeding planets would be proportionably accelerated, which would disturb y^e supposed proportion betwixt Mercuries velocity and theirs.

"Hon^d. Sir, This is y^e contents of y^e former sermon; y^e latter is an argument of a divine goodness from y^e meliority in our system, above what was necessary to be in natural causality. I hope I shall have no need to give you more trouble in y^t. But, Sir, while I am writing this, I have received a letter from my bookseller, calling away for y^e press. Let me but begg of you, by the next post, some brief hints what you approve of, and what not; for I have resolved to expect your answer, let him be never so clamorous. Sr, I heartily ask your pardon for giving you the trouble of this, which I must increase likewise by another piece of boldness in desiring your good leave to present you with my 8 poor discourses when these 2 last are made publick.

"Sir, I am your most obliged & hu. ser^t,

"R. BENTLEY.

"For

The Hon^d. MR. ISAAC NEWTON,
Math. Prof. and Fellow
of TRINITY COLLEGE, in
CAMBRIDG."

LETTER FROM SAMUEL PEPYS TO MR. NEWTON.

"Dec. 21, 1693.

"SIR,

"If to what you have done, and which I can in noe wise sufficiently acknowledge your favour in, it could bee excusable to come once more to

you upon y^e same errand; it should bee to aske you whether B's disadvantage (in his contest with A) bee anything different under his obligation to fling 2 sixes at one throw with 12 dyes, from what it would bee were he to doe it twice with 6 dyes at a time out of one box, or at once out of 2 boxes with that number in each. I being yet (must owne) unable to satisfy my selfe touching y^e difference, *i.e.*, how it arises, though at y^e same time you have putt mee beyond all doubt of A's having y^e advantage in y^e maine of B. Nor must I conceale my being at y^e same losse how to comprehend, even flinging 12 dyes at one throw out of a single box (y^e sayd dyes being tinged $\frac{1}{2}$ greene, $\frac{1}{2}$ blew), they being lesse provided for turning up a six with either of these different-coloured parcells while flung together out of y^e same box, then were y^e 6 blew to bee throwne out of one box, and y^e 6 greene from another; in which latter case, I presume each of them severally would bee equally entitled to the producing of a six with A's 6 white ones, and by consequence of 2 when flung together.

"I am conscious enough that this is but fumbling, and that it arises only from my not knowing how to make y^e full use of your Table of Progressions; but pray bee favourable to my unreadinesse in keeping pace with you therein, and give me one line of farther help. I am most thankfully, deare Sir,

"Your obliged and most humble

"and faythful servt,

"S. PEPYS."

1.—LETTER FROM DR. JOHN MILL TO MR. NEWTON.

"MY MOST HONOURED FRIEND,

"I am heartily sensible of your many signal favours and civilities to me when last at Cambridge. I hope you have not forgot your kind promise of remarking in paper your thoughts of the varieties you have met with in the Apocalypse. Whatever I have not observed already in my book, I would willingly add in my Appendix, which is going on, and will have many things in it very considerable. My book, as long as it is with you, is in as safe hands as I can desire. If you please, you may take the first fair opportunity of conveying it hither. I think the best way will be by our Oxford carrier, if the waters be low enough. You may send for him, and put the book, carefully packed up, into his own hands. And if your servant go along with him and see it put up in his pack, it will do well; we cannot be too careful in a matter of this consequence. I have been mighty curious since I saw you last, in observing something which I have all along slighted as trivial hitherto, the points of distinction in the old Alexandrian copy. And now I find them extraordinary accurate and regular; there is but one note for all manner of distinctions indeed, and

'tis at the top of a word, as our modern Greek colon (:), but then 'tis placed with such exactness and caution everywhere, as to distinguish the notions and ideas in each clause and sentence infinitely better than we could do with all our modern apparatus of distinctions. I am so very fond of their way of distinguishing the text, that I could heartily wish, when I collated the Beza MS., I had marked all the distinctions. For a last, may I presume to beg your favour to transcribe any one single page in the Greek, and to point it exactly according to the copy, 'twill be a mighty obligation.

“My most humble service to my noble worthy friend, your master, as also to Dr. Covell. He put an Arabic charm in my hands, which I have not yet returned. The next return of the carrier he shall surely receive it, with a translation of some part of it. I hope our common friend Mr. Laughton is well. Pray give him my thanks for all civilities.

“But I doubt I trespass upon your time and studies. I wish you all imaginable health and happiness, and remain ever, with the greatest sincerity of affection,

“Worthy Sir,

“Your most obedient humble servant,

“ST. EDMOND HALL, OXON,
Novr. 7, 1693.

“JO. MILL.

“These for the truly honor'd Mr. Professor NEWTON,
at his lodgings in Trinity College,
“CAMBRIDGE.”

“2.—LETTER FROM MR. NEWTON TO DR. JOHN MILL.

“S^r,

“I feare you think I have kept yo^r book too long: But to make some amends for detaining it so long, I have sent you not only my old collations so far as they vary from yours, but also some new ones of Dr. Covil's two MSS; ffor I have collated them anew, & sent you those readings w^{ch} were either omitted in yo^r printed ones, or there erroneously printed. In collating these MSS, I set the readings down in the margin of yo^r book, & thence transcribed them into a sheet of paper, w^{ch} you will find in your Book at y^e end of y^e Apocalyps, together wth my old collations, & a copy of a side of Beza's MS. The collations I send you of Dr Covil's two MSS. you may rely upon; ffor I put them into Mr. Laughton's hand wth y^e two MSS., & he compared them wth y^e MSS. and found them right. In the other collations you will find that Stephens made several omissions & some other mistakes, in collating the Complutensian edition, tho' its probable that he collated this edition wth more diligence & accurateness than he did any of y^e MSS. Where I have noted any readings of y^e Alexandrin MS., I desire you would collate that MS. again wth my reading, because I never had a sight of it. I could not observe any accurateness in y^e stops or commas in Beza's MS. You may rely upon the transcript of something more then a side of it, w^{ch} you will find in your Book at y^e end of the Apocalyps. In your little MS. book, which I return you, tyed up together

with your New Testament, you will find those transcripts you desired out of MSS., except two, which were in such running hands y^t I could not imitate them, nor did it seeme worth the while, y^e MSS. being very new ones.—I am, in all sincerity,

“Y^r most humble & most obedient servant,

“IS. NEWTON.

“TRIN. COLL. CAMBRIDGE,
Jan. 29, 1693.”

This letter is followed by one leaf headed *Spicilegia Variantium Lectionum in Apocalypsi ex MSS. Sin. et Cov. 2*. It is written on both sides, and appears to be the “sheet” referred to in line 7 of Newton’s letter. After this come two leaves containing three pages of various readings in the Apocalypse, which appeared to be “my old Collations,” referred to in line 2d of the letter.

(Referred to in page 119.)

TABLE OF REFRACTIONS SENT BY FLAMSTEED TO NEWTON.

I have thought it right, for the reasons mentioned in the note on page 119, to give the following table of refractions, communicated by Flamsteed to Newton, on the 11th October 1694, which has been omitted in the copy of the letter published by Mr. Baily in his Life of Flamsteed, p. 134.

⊙ Distantia visa a vertice.	× Refr. and ♀.	⊙ Refr. simplex.	⊙ Distantia visa a vertice.	× Refr. and ♀.	⊙ Refr. simplex.
77° 00'	2' 00''	3' 30''	88° 40'*	19' 30''	
80 00	3 40	5 10	88 52	20 50	
81 00	4 00	5 30	89 00	21 30	
82 00	5 00		89 11	23 20	
83 00	6 00		89 20	24 20	
84 00	7 00		89 27	25 30	
85 00	8 00		89 30	26 30	
86 00	10 00		89 38	27 10	
87 00	12 30	14 00	89 44	28 30	
87 30	13 30		89 49	29 20	
88 00	16 00		89 51	30 00	
88 25	17 25		89 55	31 00	
88 35	18 45		90 02	32 03	

* Dist. vera 89°.

(Referred to in page 149.)

LETTER FROM MR. FLAMSTEED TO MR. NEWTON.

"THE OBSERVATORY, Jan. 2, 1697 $\frac{2}{3}$.

"SIR,

"I was in your neighbourhood on Saturday last, but thought it [not right] to disturb you with a visit when I had nothing to offer [excepting] my respects, and the usual wishes of many happy years, this. I had not troubled you now, but that on my way home I received a letter from Dr. Wallis, in which he mentions that *I have received the packet* (that is my [letter] on the parallax of the pole star), *and at the same time I received another letter from one in London*, which desired me not to PRINT ANY PARAGRAPH OF THE LETTER WHICH SPEAKS OF YOUR GIVING MR. NEWTON OBSERVATIONS OF THE MOON. *He is a friend of both of you, but he does not give his REASONS WHY.* I thought but to acquaint you with *it, and desire your advice upon it.* Sr, I wrote my letter to Dr. Wallis in great haste, and when I had much other business in my hands, in November last, and to silence some busy people who are always asking *why I did not print*, I took occasion to let them know, that since the year 1689, when I was first fitted for it, I have been laying in a stock of observations to rectify the places of the fixed stars; that in 1694 I rectified my solar tables, and laid a foundation for the reclassification of the fixed stars; that in 1695 I furnished you with 150 observed places of the moon, and with the places also calculated from my tables, in order to the correction and restitution of her theory: That I had tables for abridging the labour (usually employed in calculating the stars' places from my *data*) under my hands and others, to make the catalogue more useful, and I wrote my letter in English, and the good Doctor having promised me a week's work as a recompense for my pains, I sent him word that I would excuse that, if he would save me the labour of putting it into Latin. It was then but three sheets which (he accepting the condition) I sent him, and thereby gained time to copy six months' observations from my books, and furnish my country calculators with the right ascensions, &c., of the stars in the southern constellations, to calculate their longitudes and latitudes from. In a fortnight's time I received two of the three sheets from the Doctor loose in a wrapper, from Dr. Gregory, with directions to leave them, when perused (for him to return), at Mr. Hindmarsh's, a bookseller's shop, *where the nonjurats resort*, in Cornhill. The third sheet soon followed, but on perusal of them I found it was requisite to add almost another, to explain some places where I had been too short, or where the Doctor, not having thoroughly understood my meaning (by reason he had not seen my instruments, nor was acquainted with my methods), had not expressed it as I would myself. This took me up more time than I expected, which made me to send my packet by the post, lest Dr. Gregory should not convey it so soon to the Doctor as I desired. However, I gave Dr. Gregory notice that I had returned it, and he was as diligent to write to Dr. Wallis as

above, for what occasion I know not. I shall give you the whole paragraph wherein I have mentioned my accommodation of you with materials, and I assure you I have not mentioned you on that account any where besides in my letter, onely [in] the book I have, where I shew that if we allow the nutation, this parallax must be greater, as much as it is. My words are these:—'Contraxeram etiam cum D^o Newtono doctissimo tunc temporis in academia Cantabrigiensi Professore necessitudinem cui lunæ loca ab observationibus meis ante habitis deducta 150 dederam, cum locis simul è tabulis meis ad earum tempora supputatis tum similia in posterum prout assequerem promiseram cum elementis calculi mei in ordine ad emendationem theoriæ lunaris Horroccianæ qua in re spero eum successus consecuturum expectationi suæ pares.'

"Sr, this is the paragraph, and *all of it*. I think there is not near so much in it as I acknowledge to myself, and (I have heard from other worthy gentlemen) you have acknowledged to them, and therefore cannot think it was from any intimation of yours (tho' he says it w^d be *displeasing to you if it were printed*), but out of a design to ingratiate with you that he put an arrest upon this paragraph. I think the word *Horroccianæ* may be omitted, tho' I put it in because you allow that theory as far as it goes, you found the faults of it by the differences from my observation. He was a countryman, and tho' your theory will be new in that (tho' you give us the reasons, and derive it from natural cause), yet he gave the groundplot, and it will be an honour both to you and me to do him justice.

"Sr, My observations lie the king and nation in at least 5000^{lb}. I have spent above 1000^{lb}. out of my own pocket in building, instruments, and hiring a servant to assist me now near 24 years. 'Tis time for me (and I am now ready for it) to let the world see I have done something that may answer this expense, and I therefore hope you will not deny me the honour of having said that I have been useful to you in your attempts to restore the theory of the moon. I might have added the observations of the comets, places given you formerly of the superior planets, and observations at the same time with the moons, but this I thought w^d look like boasting, and therefore I forbore it.

"I desire you would please to let me know by a line whether Dr. Gregory ever showed you my letter, I mean Dr. Wallis his translation of it, which I think I have altered in the paragraph above from what it was, but cannot say in what words, because I returned the Doctor his copy, with my transcript of it enlarged and altered, together; but whenever 'tis printed, you will find it agree with the copy above exactly.

"Sr, I am told Dr. Gregory is to be tutor in mathematics to the Duke of Gloucester, *which place, I was told some months ago* (when the settling of his household was first discours'd of) *was designed for me*. To make a variance betwixt you and me and Dr. Wallis, and to engage you to procure him the favour of Mr. Montague, I am apt to believe he recommends himself in this business. He thinks, perhaps, it will depreciate me, and keep me from being his competitor. Let him not trouble himself. I have an interest much beyond his whenever I please to move that way, but I do not think the Duke yet fit for a mathematical tutor, or that he will be this four or five years. I hate flattery, and shall not go to court on this account till I am sent for, or have notice that I am desired. That place might, indeed, afford me the opportunity of procuring help for my assistance, or I could

defray the charges out of pay ; but I fear it would be as prejudicial to me otherwise, and therefore shall not move to traverse the Doctor's designs, except he force me to it by his *treacherous behaviour*.

“Sr, I beg an answer to this letter speedily, and you need tell me no more but that you have seen the paragraph before, or not seen it ; that you gave such orders to Dr. Gregory or not, that I may return an answer to Dr. Wallis ; and hereafter, if any such flatterers as he come to say any thing to you that may tend to make a difference betwixt us, pray tell them you will inform me, and you will forthwith be rid of them. I shall always use the same course towards you, whereby a friendship that began early may continue long and be happy to both of us, which, through God's blessing, I hope it may, at least I shall always endeavour it, being ever, Sr,

“Your most affectionate friend and humble servant,

“JOHN FLAMSTEED, M. R.

“Pray enquire what company Dr. Gregory keeps, that you may not be deceived in his character. The Scotch think to carry all before them by the BP of Salisbury, whom I esteem (next the BP of Wester above the rest of the clergy), but I cannot think him wise in placing his countrymen about the young Duke.

“To MR. ISAAC NEWTON,

Warden of the Mint,

at his house in German Street, near

St. James's, London.—These present.”

Owing to the great decay of the paper, the first lines of this letter are hardly legible.

No. XIII.

(Referred to in page 168.)

ARTICLES OF AGREEMENT BETWEEN CHURCHILL, FLAMSTEED, AND THE REFEREES.

“Articles of agreement made this day of October,¹ in the fourth year (1705) of the reign of our Sovereign Lady Anne, by the grace of God Queen of England, Scotland, France, and Ireland, Defender of the Faith, &c., between the Honourable Francis Robarts, Esq., Sir Chr. Wren, K^t., Sir Is. Newton, K^t., David Gregory, Doctor of Physic, and John Arbuthnot, Doctor of Physic, on the one part ; Mr. John Flamsteed, Her Majesty's Astronomer at the Observatory in Greenwich, on the other part ; and Mr. Aunsham Churchill of parish, in London, on the third part.

“Whereas His Royal Highness Prince George of Denmark, out of his great generosity and propension to encourage arts and sciences, hath been

¹ Flamsteed says that they were dated November 10.

pleased to defray the charges of printing all the Astronomical Observations of the said Mr. John Flamsteed made at the said Observatory, in a book entitled *Historia Cœlestis*, and to refer the care and management of the said impression to the said Fr. Robarts, Esq., Sr Chr. Wren, Sr Is. Newton, Dr. Gregory, and Dr. Arbuthnot; and whereas the said referees, by and with the consent of the said Mr. John Flamsteed, have treated with the said Mr. Aunsham Churchill for printing the same, it is hereby covenanted and agreed between the said parties as followeth:—

“I. That the said Aunsham Churchill shall print, or cause to be printed, four hundred copies, well corrected, and only four hundred copies of the said *Historia Cœlestis*, upon the same paper, and with the same letter with the paper and letter in the specimen hereunto annexed; and for every 400 copies of every sheet so printed off, shall receive the sum of thirty and four shillings.

“II. That for making the impression correct, the said A. Churchill, at his own proper cost and charges, send the corrected proof of every sheet to the place appointed, or to be appointed by the said referees, to be there further corrected, compared with the original, and allowed by the said Mr. J. F. or his order, before the same be printed off.

“III. That the said Mr. J. F., or his said order, shall have access to the press at all times, and be allowed to stand by the same while the said number of 400 copies of any sheet or sheets shall be printed off, and then to break the press without delay, let, hindrance, or molestation of or from him the said A. Ch., or his printer, or printers, their servants or agents, or any of them, on any pretence whatever.

“IV. That the 400 copies of every sheet, within 14 days after the same shall be printed off, shall, at the charge of the said A. Ch., be sent to the order of the said referees, to be kept for his Royal Highness till the whole be printed off, excepting the two last copies of the sheet, or two copies last printed off, which, at the charges of the said A. Ch., shall be sent the one to the said J. F., or his order, the other to the order of the said trustees, to be examined and collated with the last proof, and with the original papers of the said Mr. J. F.; and that every sheet in which any error shall be found, which is not the error of the copy, be corrected, and shall be reprinted at the sole cost and charges of the said A. Ch., both for paper and printing.

“V. That the said A. Ch. shall set five sheets per week, abating only a sheet for every holiday, provided that the said A. Ch. be supplied with sufficient MS. copy, and that sufficient dispatch be made in correcting the proof-sheets.

“VI. That within two months after the said book shall be in the press, the said referees, or the major part of them, shall sign an order for the said A. Ch. to receive of the Treasurer of His R. Highness the sum of three hundred pounds, advanced in part of payment, for the paper and printing of the said book. And after the impression of the said book shall be finished, the said referees, or the major part of them, shall sign an order for the said A. Ch. to receive the remainder of the money which, after the rate of 34s. per sheet, shall then be due to him, the said A. Ch., for the paper and printing of the whole impression.

“VII. That the said A. Ch. shall not have, or claim, or endeavour to have, any right, title, or interest, either in the original copy or in the printed copies or any part thereof.”

On another leaf of the same sheet, though not immediately following the preceding articles, I find the following articles relating to Flamsteed, which, like the preceding, are written in Newton's own hand, and afford ample materials for the defence of the referees.

ARTICLES OF AGREEMENT BETWEEN FLAMSTEED AND THE REFEREES.

“I. That the book shall be printed in two volumes, the *first* to consist of three parts, namely :—

“1st, The catalogue of the fixed stars.

“2d, The observations of the fixed stars, planets, &c., by the sextant, telescope, and micrometer, from the year 1675 to the year 1689 inclusively; and

“3dly, The places of the planets and comets computed from those observations, together with a general Preface.

“The *second* to consist of two parts, viz. :—

“1st, Observations made by the wall quadrant, telescope, and micrometer in and after the year 1689, until the finishing of the impression.

“2dly, The places of the planets and comets computed from them.

“II. That Mr. Flamsteed shall, with all convenient speed, prepare and deliver in to the said referees or their order, fair and correct copies of his Catalogue of the fixed stars, and of the observations to be printed in the two volumes, with fair and correct schemes in folio, of the figures of eclipses, and other telescopic phenomena, to be graved in copper plates. And that within months he shall deliver in to the said referees a fair copy of the observations to be printed in the second volume.

“III. That the said Mr. John Flamsteed shall, with all convenient despatch, compute, or cause to be computed, the places of the planets which remain to be computed, and deliver in to the said referees fair and correct copies of all their true places, computed from the observations and well corrected, to be printed in the two volumes at the end of the Observations.

“IV. That after the first volume shall be printed off, the said referees shall sign an order for the said Mr. Flamsteed to receive of the trustees of His Royal Highness, for the charges of copying the same, and correcting the press, the sum of fifty pounds, and for the charges of computing the apparent longitudes and latitudes of the planets in that volume (not exceeding hundred l. and lat.) after the rate of 1s. 6d. per place; and for computing the true longitudes and latitudes of the moon from the apparent places, not exceeding places, after the rate of 1s. 6d. per place. And after the second volume shall be printed off, they shall sign a like order for the said Mr. John Flamsteed to receive £50 more for copying and correcting the same, after the rate of 6d. (?) per place for computing the places of the other planets in longitude and latitude, not exceeding places, and after the rate of 1s. 6d. per place, for computing the true longitudes and latitudes of the moon, not exceeding places, provided the computation be performed exactly to the satisfaction of the said referees.

“V. That the said John Flamsteed shall suffer the said referees, or their order, or any of them, to collate the said fair MS. copies and schemes, and also the printed copies, with all or any of the original papers in his custody,

from whence the said MS. copies and schemes were taken, and with the first minutes from whence those papers were drawn up, and for that end shall, at the request of the said referees, lend the said papers and minutes, or any part of them, to the order of the said referees, the person to whom they are lent giving a receipt for the same.

“VI. That the said Mr. John Flamsteed shall, before next Michaelmas,¹ fairly describe schemes in folio of a fit size for the book containing the figures of the eclipses and other telescopical observations proper to be described, of the same magnitude as in the MS., and shall assist a graver with his directions for gravating the same in copper-plate, and examine the plates and correct their faults, so that the schemes may be exact, and the said [graver] shall roll off, or cause to be rolled off, four hundred schemes from every plate, upon four hundred sheets of the same paper with that of the book, to be bound up with the book in such a manner that they may be laid open readily and conveniently.”

On the back of the folio page which contains the preceding articles, and immediately after them, I find the following paragraph, which is not numbered, but which seems to be an alternative mode of paying Flamsteed instead of the one in Art. IV.

“That the said referees, or the major part of them, shall also sign orders for the said Mr. John Flamsteed, to receive of the said Treasurer of H. R. H. the sum of two hundred and [fifty] pounds for his charges in agents, servants to calculate observations, copy papers and schemes, and correct the press, the one half thereof to be paid so soon as the first volume of the said book shall be printed off,² and the other half thereof to be paid as soon as the second volume of the said book shall be printed off, provided the same Mr. John Flamsteed shall well and truly observe, perform, fulfil, and keep all and singular the articles, covenants, and agreements above-mentioned, specified and declared, which on his part ought to be observed, performed, fulfilled, and kept.”

Immediately after this, I find the following additional article in reference to A. Churchill.

“That the said Mr. A. Ch. shall be bound in £1000 to perform the articles on his part.”

It is obvious that Flamsteed was acquainted with these articles, as he refers to Article V. in his letters to A. and F. Churchill of the 24th May and the 7th June 1706, and in his letter to Sir Christopher Wren.—See Baily's *Flamsteed*, pp. 224, 225, and 88, line 5.

No. XIV.

(Referred to in page 178.)

The following are the cancelled and the substituted paragraphs in Flamsteed's letter to Sir Christopher Wren, dated 19th July 1708 :—

¹ October 11, 1706.

² See Baily's *Flamsteed*, p. 261.

The following is the concluding paragraph in the *original* letter, but cancelled in the copy inserted by Mr. Baily in Flamsteed's Autobiography:—

“I am not only willing, but desirous, that the press should proceed to finish the first volume of Observations. I have spoke to Mr. Hodgson to take care of correcting the second proofs, and with him I shall leave the six sheets to be added; which when they are wrought off, Sir Isaac Newton has 175 sheets of the second volume in his hands, that the press may proceed with whilst I am completing the Catalogue, so there need be no stop on my account, as there never was, nor hereafter shall be, God sparing me life and health, and prospering, as I firmly believe he will, my sincere endeavours.

“I am, with all due respect, and for all your favours,
“Yr grateful and obliged humble servt.”

“JOHN FLAMSTEED, M. R.

“I think to send a copy of this letter to Mr. Roberts, and doubt not but he will impart the contents of it to Sir Isaack Newton.”

N.B.—The last three lines of the letter, from “I am, &c., to M. R.,” and the postscript, are in Flamsteed's handwriting.

The following are the concluding paragraphs substituted in the pretended copy taken from the original by Flamsteed himself:¹—

“I am as willing as you can be that the press may proceed: but to have it hurried on at this time, when I cannot possibly look after it, and only to find a printer in work who at other times has neglected it, would be a piece of folly, for which I am confident all the referees would condemn me. I must therefore entreat them that this resolve be suspended till my return out of the country; when, God sparing me life and health, I hope, with the assistance of the referees, to put the press into such a method, as it may have no stops, if any heed may [be] given to my advice.

“I beg your pardon for so long a letter: the occasion has forced me to be more troublesome than I ought to one of your age and employment. If you excuse me now I hope no further occasion will be of repeating it: and I shall ever own myself,

“Sir, your most obliged and humble servant,

“JOHN FLAMSTEED, M. R.”

No. XV.

(Referred to in pages 169, 181.)

The following document, which I found in a state of decomposition, contains an account of the expense incurred by the Prince's referees, and

¹ See Baily's *Flamsteed*.

also that which was incurred by the Government in completing the *Historia Cœlestis*, as edited by Halley. It is in Sir Isaac Newton's handwriting, and on the back of a folio containing his observations on Bernoulli's letter of the 7th June 1713:—

“ Charge.

“ I received of Edward Nicolas, Esq., at one time, £250, at another, £125—total received,	£375 0 0
“ Upon reckoning with the Prince's administrators, I paid back the balance of the account, the same being	25 3 0
	£349 17 0

“ Discharge.

“ Paid to Mr. Churchill for paper and printer,	£194 17 0
“ To Mr. Flamsteed for his copy,	125 0 0
“ To Mr. Machin, for correcting the copy by the minute-book and examining some calculations, ¹	30 0 0
	£349 17 0

“ Some time after this Dr. Halley undertook to finish the book, and the referees of the Prince acted no further, and after the work was finished and the accounts stated, moneys were impressed to me without account to pay them off.

“ Charge.

“ Received,	£364 15 0
-------------	-----------

“ Discharge.

“ Paid to Mr. Churchill for paper and printing,	£98 11 0
“ Paid for designing and gravating the draughts and rolling off the plates,	116 4 7½
“ Paid to Dr. Halley,	150 0 0
	£364 15 7½

“ Besides £20 paid to Sen^r Catenaro, which I did not bring to account.”²

See Flamsteed's Autobiography, p. 102, where he has given an impertinent account of these transactions. Flamsteed met Newton at the Ex-

¹ Flamsteed mentions this sum as given to one of Newton's servants for assisting him in the calculations.

² The “ Figures for the frontispieces and capitals” were engraved by Catenaro, who, upon “complaining that the first agreement was too hard a bargain,” received £20 additional.

chequer, when he was "passing his accounts there concerning the disbursement of the Prince's monies." He told Flamsteed of the additional £20 given to Catenaro, but he did not tell him that he paid it out of his own pocket; and Flamsteed considers it as part of the Prince's money, "thrown away by Newton only to show his liberality." The above Charge and Discharge is the account which Mr. Baily tells us he was not able to get a sight of.—Baily's *Flamsteed*, p. 102, *note*.

No. XVI.

(Referred to in page 182.)

LETTER FROM SIR ISAAC NEWTON TO MR. FLAMSTEED.

"SIR,
 "By discoursing with Dr. Arbuthnot about your Book of Observations which is in the press, I understand that he has wrote to you by her Majesty's order, for such observations as are requisite to complete the Catalogue of the Fixed Stars,¹ and you have given an indirect and dilatory answer. You know that the Prince had appointed five gentlemen to examine what was fit to be printed at his Highness's expense, and to take care that the same should be printed. Their order was only to print what they judged proper for the Prince's honour; and you *undertook, under your hand and seal, to supply them therewith*, and thereupon your Observations were put into the press. The Observatory was founded to the intent that a complete catalogue of the fixed stars should be composed by observations to be made at Greenwich, and the duty of your place is to furnish the observations. But you have delivered an imperfect catalogue, without so much as sending the observations of the stars that are wanting, and I hear that the press now stops for want of them. You are, therefore, desired either to send the rest of your catalogue to Dr. Arbuthnot, or at least to send him the Observations which are wanting to complete it, that the press may proceed. And if instead thereof you propose any thing else, or make any excuses or unnecessary delays, it will be taken for an indirect refusal to comply with her Majesty's order. Your speedy and direct answer and compliance is expected."

This draft of a letter to Flamsteed must have been written immediately after the 23d of March 1711, the date of Flamsteed's answer to Dr. Arbuth-

¹ Flamsteed, in his petition to the Queen, December 29, 1710, distinctly states that his Catalogue of 3000 Fixed Stars was finished and ready to be transcribed. "I have made further advances," he adds, "than 'tis proper to mention here, and might have presented your Majesty *with the whole work perfected before this time*, if his Royal Highness's noble intentions had not been prevented, and my endeavours continually obstructed by those who ought, and whose duty I conceive it was, to have seconded and promoted both."—Baily's *Flamsteed*, p. 278.

not's application in the name of the Queen, on the 14th of the same month. In the letter to Arbuthnot, which Newton justly characterizes as "indirect and dilatory," Flamsteed tells him that "a great deal more help is requisite, and must be procured to calculate the new Tables and the planets' places therefrom, to render the work complete, worthy of the British nation, the name it bears, her Majesty's patronage, and to commend the memory of his Royal Highness to posterity;" and he proposes that he should discourse with him a few hours, and, for that purpose, come and dine with him. The Royal Observatory was founded, as Newton states, to form a complete catalogue of the fixed stars, and Flamsteed was made Astronomer-Royal, or *Astronomical Observer*, as he was then called, for this very purpose.

LETTER FROM M. MONTMORT TO BROOK TAYLOR.

"*Avril 12, 1716.*

"Ce seroit dommage que ce bon vin fut bu par des commis de vos douanes : étant destiné pour des bouches philosophiques, et la belle bouche de Mademoiselle Barton. Je suis infiniment sensible à l'honneur qu'elle (M^{lle} Barton) me fait de se souvenir de moy. J'ai conservé l'idée du monde, la plus magnifique de son esprit, et de sa beauté. Je l'aimois avant d'avoir l'honneur de la voir, comme nièce de Mr. Newton, prevenu aussi de ce que j'avois entendu dire de ses charmes même en France. Je l'ai adorée depuis sur le temoignage de mes yeux, qui m'ont fait voir en elle, outre beaucoup de beauté, l'air le plus spirituel et le plus fin. Je crois qu'il n'y a plus de danger que vous luy fassiez ma déclaration. Si j'avois le bonheur d'estre auprès d'elle ; je serais aussitot et aussi embarrassé que je le fus la première fois. Le respect et la crainte de luy déplaire m'obligeroit ce [de] me taire et à luy cacher mes sentimens. Mais à 100 lieues loin et séparé par la mer je crois qu'un amant peut parler sans être temeraire, et une dame d'esprit souffrir des déclarations sans qu'elle puisse se reproché[r] d'avoir trop d'indulgence. Il vint icy, il y a quelques jours, une personne de sa part. Je n'y étois pas, vous pouvez croire qu'il fût bien reçu par Mad^{me} de Montmort aussitot qu'il se fut nommé de Mad^{elle} Barton. Il ne voulust point dire ce que l'amenoit, il dit seulement qu'il reviendrait. Mad^{me} de Montmort jugea que c'est une personne qui fait icy des commissions pour des personnes de qualité d'Angleterre. Je voudrais bien que Mad^{elle} Barton voulust m'honorer du soin du luy faire les emplettes et de me faire son comissionnaire. Outre le plaisir de servir une si belle personne j'aurais celui de m'acquitter envers Mr. Newton d'une partie des obligations que je luy ai."

No. XVIII.

(Referred to in page 215.)

EXTRACTS FROM SWIFT'S LETTERS TO STELLA, IN WHICH MRS. BARTON
AND LORD HALIFAX ARE MENTIONED.

"1710, *Sept.* 28.—I dined to-day with Mrs. Barton alone at her lodgings."¹

"1710, *Oct.* 1.—To-morrow I go with Delaval, the Portugal envoy, to dine with Lord Halifax at Hampton Court."

"1710, *Oct.* 13.—Lord Halifax is always teasing me to go down to his country house,² which will cost me a guinea to his servant, and twelve shillings coach hire, and he shall be hanged first. Is not this a plaguy silly story? But I am vexed at the heart, for I love the young fellow, and am resolved to stir up people to do something for him. He is a Whig, and I'll put him upon some of my cast Whigs, for I have done with them, and they have, I hope, done with this kingdom for our time."

"1710, *Oct.* 14.—What, another! I fancy this is from Mrs. Barton; she told me she would write to me, but she writes a better hand than this."

"1710, *Nov.* 28.—Lord Halifax sent to invite me to dinner, where I staid till six, and crost him in all his Whig talk, and made him often come over to me."

"1710, *Nov.* 30.—To-day I dined with Mrs. Barton alone."

"1710, *Dec.* 19.—I visited Mrs. Barton."

"1711, *Jan.* 23.—I called at Mrs. Barton's, and we went to Lady Worsley's,³ where we were to dine by appointment."

"1711, *Jan.* 24.—As for my old friends, I never see them, except Lord Halifax, and him very seldom."

"1711, *March* 7.—Mrs. Barton sent this morning to invite me to dinner, and there I dined just in that genteel manner that M. D. (Stella and Dingley) used, when they would treat some better sort of body than usual."

"1711, *April* 3.—I was this morning to see Mrs. Barton. I love her better than any body here, and see her seldomer. Why really now, so it often happens in the world that when one loves a body best—psha, psha, you are so silly with your moral observations."

"1711, *April* 10.—I have been visiting Lady Worsley and Mrs. Barton to-day."

"1711, *May* 29.—Pr'ythee, don't you observe how strangely I have

¹ This is the only place where Swift speaks of Mrs. Barton's lodgings; and it is important to observe, that Newton was at that very time removing from Chelsea to St. Martin's Street, so that Mrs. Barton was probably occupying lodgings for a short time while the house was preparing for her uncle. It is quite clear also, from the extracts dated October 9, 25, and November 28, 1711, that Mrs. Barton was living at Newton's house in Leicester Fields. At this time, too, Mrs. Barton, at Swift's request, carried a message from Bolingbroke to Newton.—See this volume, p. 206, and Edleston's *Correspondence*, &c., Lett. xxi. p. 36.

² Had Mrs. Barton lived with Halifax, Swift, "who loved her better than any body in London," would not have been teased by the invitation.

³ The wife of Sir Robert Worsley, Bart., and only daughter of Viscount Weymouth.

changed my company and manner of living? I never go to a coffee-house; you hear no more of Addison, Steele, Henley, Lady Lucy, Mrs. Finch, Lord Somers, Lord Halifax, &c."

"1711, *July* 6.—An ugly rainy day; I was to visit Mrs. Barton."

"1711.—*July* 18.—To-day I took leave of Mrs. Barton, who is going into the country."

"1711, *Oct.* 9.—I lodge, or shall lodge by Leicester Fields. . . Did I tell you that my friend Mrs. Barton has a brother drowned, that went on the expedition with Jack Hill? He was a Lieutenant-Colonel, and a coxcomb; and she keeps her chamber in form, and the servants say she receives no messages."

"1711, *Oct.* 14.—I sat this evening with Mrs. Barton; it is the first day of her seeing company; but I made her merry enough, and we were three hours disputing upon Whig and Tory. She grieved for her brother only for form, and he was a sad dog."

"1711, *Oct.* 25.—I sat this evening with Mrs. Barton, who is *my near neighbour*."¹

"1711, *Nov.* 20.—I have been so teased with Whiggish discourse by Mrs. Barton and Lady Betty Germaine,² never saw the like. They turn all this affair of pope-burning into ridicule, and indeed they have made too great clutter about it, if they had no real reason to apprehend some tumults."

"1711, *Nov.* 28.—I am turned out of my lodging by my landlady, but I have taken another lodging hard by in Leicester Fields."

"1711, *Dec.* 16.—I took courage to-day, and went to Court with a very cheerful countenance. It was mightily crowded; both parties coming to observe each other's faces. I avoided Lord Halifax's bow till he forced it on me, but we did not talk together."

After reading the preceding passages, it would be difficult to understand how Mrs. Barton, whom Swift esteemed and loved, could have ever resided under the roof of Lord Halifax as his mistress.

The following letter^s endorsed by Swift, "My old friend Mrs. Barton, now Mrs. Conduitt," is the only one of hers that has been preserved:—

"GEORGE STREET, November 29, 1733.

"SIR,

"Mrs. Barber did not deliver your letter till after the intended wedding brought me hither. She has as much a better title to the favour of her sex than poetry can give her, as truth is better than fiction, and shall have my best assistance. But the town has been so long invited into the subscription, that most people have already refused or accepted, and Mr. Conduitt has long since done the latter. I should have guessed your holiness would rather have laid than called up the ghost of my departed friendship, which since you are brave enough to face, you will find divested of every terror,

¹ Mrs. Barton lived with Newton in Martin Street, Leicester Fields.

² Professor De Morgan says that Mrs. Barton's intimacy with Swift was probably through Halifax. It was more probably through Lady Betty Germaine, whom Swift had known from her childhood. Lady Betty was a daughter of the Earl of Berkeley, to whom Swift had been chaplain and private Secretary. Many of her letters to Swift are published in his *Correspondence*.

³ Swift's *Works*, vol. xvii. p. 101. Edit. Edin. 1784.

but the remorse that you were abandoned to be an alien to your friends, your country, and yourself. Not to renew an acquaintance with one who can twenty years after remember a bare intention to serve him, would be to throw away a prize I am not now able to repurchase; therefore, when you return to England, I shall try to excel in, what I am very sorry you want, a nurse. In the mean time I am exercising that gift to preserve one who is your devoted admirer.

“Lord Harvey has written a bitter copy of verses upon Dr. Sherwin, for publishing, as ’tis said, his Lordship’s epistle, which must set your brother Pope’s spirits all a working. Thomson is far advanced in a poem of 2000 lines, deducing liberty from the patriarchs to the present time, which, if we may judge from the press, is now in full vigour. But I forget I am writing to one who has the power of the keys of Parnassus, and that the only merit my letter can have is brevity. Please therefore to place the profit I had in your long one to your fund of charity, which carries no interest, and to add to your prayers and good wishes now and then a line to

“Sir, your obedient humble servant,
“C. CONDUIT.

“Mrs. Barber, whom I had sent to dine with us, is in bed with the gout, and has not yet sent me her proposals.”¹

I.—LETTER FROM VARIGNON TO NEWTON.

“Nobilissimo Doctissimoque Viro

“D. D. Newtono Equiti Aurato

“Regiæ Societatis Anglicanæ Præsidi Dignissimo

“S. P. D. Petrus Varignonius.

“Exoptatissimam mihi Effigiem tui, quâ me donare dignatus es, vir humanissime ac munificentissime, gaudenti gratissimoque animo nuper accepi. Tui spectandi percupidus capsam statim distraxi, evolutâque telâ, in hujus effigiei vultu et fronte et oculis quasi spirans mihi visum est tuum summum atque eminentis ingenium cum oris dignitate conjunctum, etiamnumque videtur. Paucis post diebus venit ad me Cl. Taylorus (quatuor abhinc vel quinque mensibus hic habitans) qui eam intuitus attente, suo usus conspicio, tibi simillimam esse pro certo mihi affirmavit; quod admodum me delectavit ac delectat. Porro sculptam alteram tui imaginem,

¹ Mrs. Barber was a great friend and favourite of Swift. She was the author of a volume of poems, which were dedicated to the Earl of Orrery, and the proposals here referred to, were probably proposals to publish her poems by subscription.—See Swift’s *Works*, vol. xvii. p. 77, and vol. xviii. p. 55.

jam inde a decem circiter annis habebam ex dono amici Angli (Oxonienſis nomine Arnold) qui cum me ſæpius de te magnalia loquentem audisset, reversus Londinum, illinc eam ad me miſit, pergratam mihi fore exiſtimans: recte quidem. Sed cum Sculpta tui ſimilitudinem ex vero non effingat æque ac picta, hanc nihilominus ſemper exoptavi, quâ nunc mihi datur videre tandem illuſtriſſimum ac doctiſſimum eum virum quem amplius triginta annos ſummâ veneratione colebam ob ingentia ejus merita præſertim in Mathesiſ quam promovit et auxit immensum, cujuſque legibus aſtrictam primus demonſtravit eſſe Naturam. Quantas autem pro tanto dono (quod antea pecuniæ ſummâ quâvis emiſſem ſi aliunde quam a perhonorifica mihi tuæ liberalitatis magnificentiâ obtinere potuiſſem) gratias agere tibi debeam, optime intelligo et intime ſentio. Sed tantas ut eas expedire verbis nequeam; nec etiam eas quas habeo tibi maximas pro eo quod me monuit Cl. Moivreus te non dedignari mei quoque imaginem quam nudiusquartus idcirco miſi D^o Ayres (capellano D. D. Equitis Sutton, excellentiſſimi legati veſtri apud nos) in longiore capsula volutatam, quam pridie mihi officioſiſſime promiſerat ſe miſſurum fore Londinum ad D^{um} Preverau (apud D. D. Craggs Sanctioris conſilii Anglicani commentarienſem) ut eam tibi reddat, quam benigne accipias rogo. Vale, mihi que tuorum in me Beneficiorum æternum memori favere perge.

“Dabam Pariſiis, Die 28th Novemb. 1720, N. S.

“P.S.—Post Scriptam hanc Epistolam D. Nicole ex Angliâ recens me in-visit ac monuit, dum apud te pranderet, aut cœnaret, propinasse te toti generatim academiæ noſtræ Pariſienſi, ſpeciatiſſimè Cl. Fontenelle, ac etiam mihi; pro quo honore novas habeo tibi gratias et ago maximas. Contemplatus etiam D^{us} Nicole pictam effigiem tui, de eâ cenſuit penitus idem ac D. Taylorus nimirum eam tibi perſimilem eſſe; quod meum de eâ obtentâ gaudium auxit.”

2.—LETTER FROM NEWTON TO VARIGNON.

“Viro celeberrimo D^{no} Abbati Varignon Regio Mathesis Professoſſori et Academiæ Scientiarum Socio apud Pariſienſes
Is. Newtonus S. P. D.

“Clarissime D^{ne},

“Accepi Historiam et Commentaria ex Archivis Academiæ Scientiarum pro anno 1719, pro quibus gratias tibi reddo quammaximas. Accepi etiam schedam primam Libri de Coloribus elegantem sane et specie nobilem. Et ne D^{nus} Montalanus expensa moleste habeat dabo illi libras viginti sterlingas, et expensa compingendi libros insuper solvam. Gratias tibi reddo quamplurimas quod insinuasti libros plures amicis donandos eſſe, ſcilicet Cardinali Polignac, et filio Cancellarii, et Bibliothecæ Academiæ. Vellem et alios donandos eſſe filio et nepoti D. Joannis Bernoullii, et alios Abbati de Comitibus,¹ et P. Sebastian, et D. Remond. Sed et gratias tibi maxi-

¹ The Abbé Conti. Newton must have forgotten or forgiven the offence which he had taken at the Abbé, for having “assisted Leibnitz in engaging him in new disputes.”

mas reddo quod onus in te suscipere digneris conferendi correctiones Dⁿⁱ Coste et Dⁿⁱ Moyvre inter se, et quod optimum videbitur eligendi; ut et emendandi quæcunque alia occurrerint. Metuebam utique ne correctiones Dⁿⁱ Coste, inter plurima tua negotia, molestiam nimiam tibi crearent. Sed cum hocce onus in te suscipere non dedigneris, eo magis me tibi obligasti. Schema tuum libris singulis præfigendum probo, sed nondum a Pictore delineatum est. Pictorem mox adibo.

“In sententia mathematici Judicis quam D. Leibniti^{us} D. Joanni Bernoullio ascripsit, publice accusor plagii. Et epistola quam D. Bernoullius ad me misit, et qua se talem sententiam scripsisse negavit, videbatur ad me missa ut remedium contra injuriam illam publicam: et eo nomine licentiam mihi datam esse putabam diluendi injuriam illam auctoritate De Bernoullii, præsertim cum is me non prohibuerit. Attamen Epistolam illam non nisi privatim communicavi, et Keilio nullam dedi licentiam aliquid evulgandi ex eadem, et multo minus scribendi contra Bernoullium ob ea quæ in Epistola illa mihi amice scripserat. Et hac de causa Keilium quasi liti studentem vehementer objurgavi: sed ille jam mortuus est.¹

“Conqueritur D. Bernoullius quod ipsum vocavi *hominem novum*, et *mathematicum fictum*, et *Equitem erraticum*. Sed contra Bernoullium nondum cœpi scribere. Hæc omnia dixi scribendo contra Leibnitium, et ejus argumenta repellendo.

“1. Dixerat utique D. Leibniti^{us} *Keilium esse hominem novum et rerum anteaclarum parum peritum cognitorem*, id est, hominem qui floruit post tempora Commercii quod Leibniti^{us} habuit cum Oldenburgio: et idem objeci Leibnitio Bernoullium judicem constituenti, cui utique commercium illud antiquum annis plus triginta post mortem Oldenburgii ignotum fuerat.

“2. Cum D. Leibniti^{us} sententiam Judicis mathematici Bernoullio ascriberet, vocavi judicem illum *mathematicum* vel *fictum mathematicum*, id est, mathematicum qui vere author esset sententiæ illius, vel fingebatur esse author. Nam cum Bernoullius ab authore sententiæ illius citabatur tanquam ab authore aversus, dubitabam utrum ille author esset, necne. Et Bernoullius ipse literis ad me datis affirmavit se non fuisse authorem.

“3. D. Leibniti^{us} in Epistola sua prima ad Abbatem de Comitibus quæstionem de primo methodi differentialis inventore deseruit, et ad disputationem novas confugit de gravitate universali et qualitibus occultis et miraculis et vacuo et atomis et spatio et tempore et perfectione mundi: Et sub finem Epistolæ Problema Bernoullii ex Actis Eruditorum desumptum proposuit mathematicis Anglis: Et initio proximæ suæ ad abbatem Epistolæ contulit hanc novam controversiam cum *duello*, scribens se nolle in arenam descendere contra milites meos emissarios, sed cum ipse appare-

See pp. 239, 240, and APPENDIX No. I. p. 347. The conduct of the Abbé in reference to his Chronology appears to have revived the former feelings of Newton.

¹ John Keill was born in Edinburgh in 1671, and studied mathematics there under David Gregory, whom he accompanied to Oxford in 1694, having obtained one of the Scotch Exhibitions in Balliol College. He acquired a high reputation at Oxford as a teacher of the Newtonian philosophy, with apparatus provided by himself. His *Introductio ad Veram Physicam* appeared in 1701, and his *Introductio ad Veram Astronomiam* in 1708. He was appointed Savilian Professor of Astronomy at Oxford in 1710, and in 1711 he entered the lists against Leibnitz and Bernoulli, as the able and staunch champion of Newton, as will be seen in Chapters XIV. and XV. of this work. He died in 1721, in the 50th year of his age.

rem, se lubenter mihi satisfactionem daturum. Et ad hæc omnia alludens non contra Bernoullium sed contra Leibnitium scripsi in observationibus meis in hanc ejus Epistolam, ubi dixi quod *Epistolæ et chartæ antiquæ* (ex mente Leibnitii scilicet) *jam abjiciendæ sunt, et Quæstio* (de primo methodi inventore) *deducenda est ad rixam circa Philosophiam et circa res alias: et magnus ille Mathematicus quem D. Leibnitius judicem sine nomine constituit, jam velum detrahere debet* (secundum Leibnitium scilicet) *et a partibus Leibnitii stare in hac rixa, et chartam provocatoriam ad mathematicos in Anglia per Leibnitium mittere quasi duellum, vel potius bellum, inter milites meos emissarios* (uti loquitur) *et exercitum discipulorum in quibus se felicem jactat; methodus esset magis idonea ad Quæstionem de primo inventore dirimendam quam examinatio veterum et authenticorum scriptorum, et scientiæ mathematicæ in posterum factis nobilibus equitum erraticorum vice argumentorum ac Demonstrationum implendæ essent.*

“Hoc totum contra Leibnitium scripsi, et non contra Bernoullium. Leibnitius Bernoullium constituit judicem. Leibnitius eundem ex judice constituit advocatum. Leibnitius Commercium Epistolicum fugit quasi a judice suo condemnatum. Leibnitius vice Quæstionis de primo Inventore disputationes novas de Quæstionibus Philosophicis proposuit, et Problema tanquam a Bernoullio misit a Mathematicis Anglis solvendum. Leibnitius fuit eques ille erraticus qui vice argumentorum ex veteribus et authenticis scriptis desumendorum, introduxit alias disputationes, quas ipse contulit cum duello. Ad hoc duellum ille me provocavit methodi infinitesimalis gratia. Hæc methodus erat virgo illa pulchra pro qua eques noster pugnat. Quæstionem de primo methodi hujus inventore per victoriam in hoc duello dirimere sperabat, et Virginem lucrari non examinatis veteribus et authenticis scriptis in Commercio Epistolico editis, per quæ Quæstio illa dirimi debuisset. Problemata mathematica proponi possunt exercitii gratia, sed non ad dirimendas lites alterius generis: et solus Leibnitius eadem in hunc finem proposuit.

“Hæc tibi scripsi non ut in lucem edantur, sed ut scias me nondum cum Bernoullio lites habuisse. Contra illum nondum scripsi, neque in animo habeo ut scribam: nam lites semper fugi.

“D^s. Moivreus mihi dixit D. Bernoullium picturam meam optare: sed ille nondum agnovit publice me methodum fluxionum et momentorum habuisse anno 1672, uti conceditur in Elogio D. Leibnitii in Historia Academiæ vestræ edito. Ille nondum agnovit me in Propositione prima Libri de Quadraturis, anno 1693 a Wallisio edita, et anno 1686 in Lem. 2 Lib. 2. Princip. synthetice demonstrata, Regulam veram differendi differentialia dedisse, et Regulam illam anno 1672 habuisse, per quam utique curvaturas curvarum tunc determinabam. Ille nondum agnovit me anno 1669, quando scripsi Analysisin per series, methodum habuisse quadrandi curvilineas accurate, si fieri possit, quemadmodum in Epistola mea 24 Octob. 1676, ad Oldenburgium data, et in Propositione quinta Libri de Quadraturis, exponitur; et Tabulas Curvilinearum quæ cum Conicis Sectionibus comparari possunt per ea tempora a me compositos fuisse. Si ea concesserit, quæ lites prorsus amovebunt, picturam meam haud facile negabo. Vale.

“DABAM LONDINI,
26 Sept. 1721. St. Vet.”

Varignon, in replying to this letter on the 9th December 1721, N.S., acknowledges having received it by the hands of M. Arlaud,¹ “qui gratisime mihi de te narravit, et cum quo ad multam usque noctem honorificentissime de te sum collocutus.” Then follows the paragraph relating to Bernoulli, which we have already given in page 228, and the letter concludes with some details respecting the frontispiece and diagrams for the French edition of his *Optics*, then publishing under the superintendence of Varignon.

1.—LETTER FROM JOHN BERNOULLI TO NEWTON.

“Viro Illustrissimo atque Incomparabili Isaaco Newtono S.P.D.
Johannes Bernoulli.

“Opticam tuam Angl. à te mihi dono datam nuper accepi missu Celeb. Variguoni, à quo etiam exemplar Lat., sicut intelligo, accepturus sum. Pro utroque hoc egregio munere non minus quam pro aliis jam sæpius mihi acceptis tanquam totidem tuæ erga me benevolentia signis nunc denum debitas persolvo gratias, quas, quod fateor, dudum persolvere debuissim. Noli, quæso, officii hujus neglecti causam imputare animo ingrato et beneficiorum immemori, à quo semper quam maxime abhorruï; noli etiam credere, me ideo minus ingentia tua merita coluisse. Quin potius, si quid fidei verba merentur, id tantum ex silentio meo colligas velim, quod te divini ingenii virum, cui parem non habet ætas nostra, ego præ summa veneratione compellare non audebam; certe ne nunc quidem auderem, nisi nuper, quod animum addidit, intellexissem, juxta stupendas ingenii dotes etiam comitatis et affabilitatis virtutem usque adeo esse tibi conuatum, ut ab inferioris conditionis hominibus, qualem me lubens profiteor, litteras accipere plane non detrectes. Cæterum quanti aestimaverim tuam amicitiam, qua, uti percepi ex litteris virorum clariss. Monmortii et Moivreï, me antehac dignatus es, eosdem hos viros antestor, ac præsertim quidem Moivreum, qui ea de re luculentissimum testimonium coram perhibere poterit. Sed nescio quî factum, ut post accensam facem feralis illius belli, quod maximo scientiæ Mathematicæ probro ante aliquot annos exortum inter quosdam utriusque nationis Britannicæ et Germanicæ Geometras, ego nec Britannus nec Germanus sed Helvetius, qui à partium studio alienissimus sum, et quidvis potius facerem, quam aliorum litibus me sponte immiscere, gratia tamen tua, ut fama fert, exciderim. Quod si ita esset, quamvis contrarium sperem, non possem non credere, hocce infortunium fuisse mihi conflatum à supplantatione quorundam sycophantarum, qui ex rabida quadam aviditate sibi suisque popularibus ædificandi

¹ M. Arlaud, an eminent Swiss painter, who resided in Paris, and improved some of the diagrams for Coste's French translation of Newton's *Optics*, which appeared in 1722.—See Edleston's *Correspondence*, &c. p. 85.

monumenta ex ruderibus destructæ aliorum existimationis et famæ, nos omnes non-Anglos insontes cum sontibus, nî statim per omnia applaudere velimus, acerbissimis contumeliis proscindunt. Itaque non dubito quin tibi, vir maxime, de me quoque multa falsa et conficta fuerint narrata, quæ gratiam, qua apud te flagravi, si non delere, saltem imminuere potuerunt. Sed non est ut multis me excusem: provoco ad scripta mea quæ extant; docebunt quam singulari cum laude de te tuisque inventis, quavis data occasione, locutus fuerim. Ecquis aliter posset, qui magnitudinem meritorum tuorum considerat? Quam mirabundus autem etiamnum illa deprædicem atque extollam quovis loco et tempore, privatim æque ac publice, in litteris, in sermonibus, in orationibus, in prælectionibus, illos loqui sinam qui me legunt, qui me audiunt. Sane si quid sapio, gratior erit posteritati commemoratio meritissimæ tuæ laudis à nobis instituta, utpote ex sincero animo et calamo profecta, quam nonnullorum ex vestratibus immodicus ardor (non dico te laudandi, nam satis laudari non potes, sed) tibi omnia, etiam ea quæ ipse non desideras, arrogandi, et exteris relinquendi nihil. Fallunt haud dubie, qui me tibi detulerunt tanquam auctorem quarundam ex schedis istis volantibus, in quibus forsitan non satis honorifica tui fit mentio. Sed obsecro te, vir inelyte, atque per omnia humanitatis sacra obtestor, ut tibi certo persuadeas, quicquid hoc modo sine nomine in lucem prodierit, id mihi falso imputari. Non enim mihi est in more positum, talia protrudere anonyma quæ pro meis agnoscere nec vellem nec auderem. At vero non sine dolore audiivi, te in quibusdam Epistolis libro (quem non vidi) cl. Raphsoni annexis ita de me loqui, ut inde concludi possit, quod me suspiceris auctorem nescio cuius scripti sine nomine publicati, et quod suspicio ista tibi subnata sit ex litteris quibusdam Leibnitii, qui me Auctorem esse affirmaverit. Quale fuerit illud scriptum jam non inquiri, interim certum te volo, à me non esse profectum, si præsertim tibi, quem tanti facio, non usquequaque esset decorum; absit autem ut credam Leibnitium, virum sane optimum, me nominando fucum vobis facere voluisse; credibile namque potius est ipsum vel sua vel aliorum conjectura fuisse deceptum; qua in re etsi data opera me offendere noluerit, non tamen omni culpâ vacabat, quod tam temere et imprudenter aliquid perscripserit, cuius nullam habebat notitiam; fecisset utique melius, si antea ex me ipso quid de re esset rescivisset. Sed festinabat vir bonus, existimans forsitan, causam suam aliquid inde roboris accepturam, parum sollicitus, utrum mihi incommoda necne futura esset conjecturalis illa relatio. Sed tandem absolvo, hoc unum maxime in votis habens, ut, nullo relicto dubio, tibi liquidissime constet animi in te mei integritas atque candor conjunctus cum perpetua tui admiratione atque veneratione, ut constet quoque me grata et memori mente usque et usque recolere quæ in me contulisti favoris et amoris signa. Non enim sum nescius, quantum tibi debeam nactasti, sed et pro honorifica mei in vestram Societatem Reg. Scient. receptione, quippe quam ex tua commendatione mihi contigisse omnino perspectum habeo. Quod superest, Vale, Vir Illustrissime, atque mihi immortalium tuorum meritorum cultori studiosissimo fave. Dabam Basilea, a. d. iiii. Non. Quintil.¹ CIOIÖCCXIX.

¹ July 5th.

2.—LETTER FROM JOHN BERNOULLI TO NEWTON.

“Prænobili ac Toto Orbe Celeberrimo Viro D. Isaaco Newtono S. P. D.
Joh. Bernoulli.

“Litteræ Tuæ insigni voluptate me affecerunt, Vir Illustrissime. Ex iis intellexi Te, neglectis litibus mathematicis, eadem me prosequi benevolentia et amicitia, qua me olim dignatus fueras. Facis certe prout decet virum candidum et generosum, qui non facile patitur sibi eos designari, quos amore suo dignos judicat. Qualis sit epistola illa, de qua dicis quod sit 7 Junii 1713 data ad D. Leibnitium, mihi non constat. Non memini ad illum eo die me scripsisse, non tamen omnino negaverim, quandoquidem non omnium epistolarum à me scriptarum apographa retinui. Quodsi fortassis inter innumeras quas ipsi exaraveram una reperiretur, quæ dictum diem et annum præ se ferret, pro certo asseverare ausim, nihil in ea contineri quod probitatis nomen tuum ullo modo convellat, neque me unquam ipsi veniam dedisse, ut quasdam ex Epistolis meis in publicum ederet, et talem imprimis quæ tibi, etsi contra spem et voluntatem meam, non arrideret. Quocirca denuo te rogo, vir illustr., velis tibi persuasum habere, mentem mihi nunquam fuisse aliter de te loqui quam de viro summo, nedum existimationem tuam vel probitatem sugillare. Absit ut dicam, te famam apud externas Gentes captasse; spero tamen, te non respuere elogia à nobis ultro oblata, utpote sincera et te digna, atque adeo magis acceptanda quam quæ ex immoderato partium studio offeruntur. Quod tibi jam seni (cui incolunitatem per novum quem propediem auspicabimur annum et per multos secuturos ex animo apprecor) non liceat studiis mathematicis incumbere, acerbe dolebit Orbis eruditus, quem hucusque ditasti tot stupendis inventis. Ego quidem nondum senex, ad senium tamen vergo, aliisque distringor negotiis, ut nec mihi amplius fas sit rei mathematicæ tam sedulam operam dare, uti solebam. Quod memoras, vir Amplissime, de libro Raphsoni, eum scil. iterum impressum esse cum nonnullis Leibnitii epistolis, in quibus affirmet, me Auctorem esse prædictæ epistolæ (quæ quid contineat probitati tuæ injurium hariolari non possum), hoc certe liti sopiendæ non conducit; ipsum vero librum Raphsoni fortasse nunquam videbo, quia ejusmodi libri ex Hollandia huc raro deferuntur. Hoc interim considerari à vestratibus vellem, si per testimonia certandum esset, melius id fieri adducendo alias epistolas quam a Leibnitio scriptas, quippe qui in propria causa non haberi potest pro idoneo teste. Sunt mihi epistolæ virorum quorundam doctorum ex nationibus nullam in hac lite nationali partem habentibus, quas si publici juris facerem, nescio an illi ex vestratibus, qui tanto cum fervore ad injurias usque mecum expostulant, magnam inde gloriandi causam acquirerent. Habeo inter alia documenta authentica apographum à D. Montmortio nuper defuncto mathematico, ut nosti, dum viveret perdocto atque nulli parti addicto, utpote Gallo; habeo, inquam, apographum ab eo mihi transmissum alicujus epistolæ, quam ipse ad cl. Taylorum scripserat 18 Decemb. 1718, et quæ vel sola magnam litis partem dirimeret, sed non ex voto Taylori cæterorumque ejus sequacium.¹ Ab istis autem evulgandis libenter abstinebo, modo vestri desinant, quod pacis causa optarem, nostram lacessere patientiam. Lubens credo quod

¹ This letter will be found in p. 398, sect. 3.

ais de aucto Corollario I, Prop. xiii. Lib. 1. Operis tui incomparabilis Princip. Phil., hoc nempe factum esse antequam hæc lites cœperunt, neque dubitavi unquam, tibi esse demonstrationem propositionis inversæ quam nude asserueras in prima Operis Editione; aliquid dicebam tantum contra formam illius asserti, atque optabam, ut quis analysin daret qua inversæ veritatem inveniret à priori, ac non supposita directa jam cognita. Hoc vero, quod te non invito dixerim, à me primo præstitum esse puto, quantum saltem hæcenus mihi constat. Unum superest, quod pace tua monendum habeo. Retulit mihi nuperrime Amicus quispiam ex Anglia redux, me esse ejectum ex numero Sodalium Illustr. vestræ Societ. Reg., id quod collegerit ex eo quod nomen meum non reperit in Catalogo Londini viso Sociorum (in ampla scheda annuatim imprimi solita) pro anno 1718. Et quominus dubitare monstravit mihi librum aliquem Anglicum impressum an. 1718, cui titulus *Magnæ Britannicæ Notitia*, ubi in parte postrema pag. 144 videre est Catalogum Membrorum exterorum Societatis Regiæ, atque in illo nomen Agnati mei, sed meo nomine, quod miror, prorsus exulante. Liceat ergo ex te quærere, utrum ex decreto Illustr. Societatis fuerim expunctus, et quid peccaverim vel quonam delicto ejus indignationem in me concitaverim, an vero Secretarius (qui nî fallor tum temporis fuit Taylorus) propria auctoritate me proseripserit. Quid? ideone locum in illustri hoc corpore mihi non ambientis tam honorifice obtulissetis, ut postea tanto turpius ex eo me ejiceretis? Hoc equidem ob insignem vestram æquitatem suspicari vix possum. Quare enixe te rogo, vir Nobilissime, ut quid ea de re sit me quantocyus facias certiozem. Vale, ac mihi studiosissimo tui porro fave. Dabam Basileæ, a d. xxi. Decemb. CLOIIOCCXIX.

3.—LETTER FROM JOHN BERNOULLI TO NEWTON.

“ Illustrissimo atque Nobilissimo Viro Isaaco Newtono S. P. D.
Joh. Bernoulli.

“ Ad te iterum venio, Vir Inelyte, ut iteratas persolvam gratias pro novo munere quo me beasti, nec me tantum, sed et filium meum atque Agnatum. Accepi nimirum tria inter nos tres distribuenda Exemplaria nitidissime compacta Optices tuæ Parisiis nuper editæ, quæ Cl. Varignonius, paulo ante obitum suam, cunctis qui sinceritatem cum eruditione conjunctam amant vehementer lugendum, mihi nomine tuo transmiserat. Etsi nesciam quid sit quo hanc tuam erga me meosque munificentiam demeruerim aut postea demereri possim; id saltem persuasum tibi habeas, vir maxime, neminem esse qui immortalia tua inventa ex vero rerum pretio pluris æstimet et simul sincerius quam ego. Hoc cumprimis quod de Lumine et Coloribus systema pro ingenii tui sagacitate felicissime eruisti me summum habet admiratorem; inventum sane quovis ære perennius et à posteritate magis quam nunc fit suspiciendum. Sunt enim qui illud partim ex invidia partim ex imperitia obtractare non verentur, quin et cum nihil habent quod pretium ejus imminuat, audent inventionis laudem tibi surripere eamque sibi arrogare. En exemplum in quodam Hartsoekero, homine inepto et in Geometria prorsus hospite, qui in opusculo aliquo in lucem protruso perfricta fronte sustinet novam tuam Colorum theoriam eorumque diversam refrangibilitatem sibi dudum notam variisque experimentis perspectam fuisse, antequam quicquam ea de re inventum à te aut evulgatum fuisset, quod apud me summam excitavit indignationem, sicut et hoc quod

reliquas tuas rerum Physicarum explicationes utut ingeniosissimas, præsertim quæ ad systema planetarium spectant, ubi omnia cum phænomenis tam mirifice consentiunt, admodum salse et scoptice traducit, quamvis de rebus istis non aliter argumentetur quam cæcus de colore, nec mirum, siquidem homo sit ἀγεωμέτρητος et omnis humanitatis experts, nemini parcens, imo summorum virorum atque de re mathematica ac philosophica optime meritorum famam arrodere non dubitans. Ita ut mirer, neminem ex vestratibus adesse, qui tuam, Vir Illustrissime, existimationem vindicet contra rudem et barbarum hominem. Ad me quod attinet, fateor me ab illo tractari multo acerbius; nihil enim injuriarum est, nihil aculeorum quod in me non sparserit, idque non aliam ob causam quam quod aliquis ex meis discipulis phosphorum meum mercurialem ab illius morsibus defenderit. Licet indignus sit homo cui ego respondeam, unum tamen est quod me magnopere urit; scilicet, ut me omnium risui exponat, impudentissime comminiscitur, me mihimet ipsi tribuisse titulum *excellentis Mathematici*, et, ut calumniæ crimen à se amoliat, te, Vir Illustrissime, ejus Auctorem facit, dum locum citat ex tomo 2. Collectaneorum Dⁱ. Desmaiseaux (*Recueil de diverses pièces*), p. 125, l. 32, ubi loqueris de epistola illa 7 Junij 1713, quam Leibnitiis à me scriptam esse contenderat, et in qua prout erat impressa in scheda illa volante 29 Julij 1713, elogium illud, sed quod parenthesi includebatur, mihi erat adscriptum. Hinc malitiose colligit calumniator, quasi insinuare volueris, me eò arrogantia processisse ut hunc mihi titulum sumserim, cum tamen te voluisse contrarium dicere luculentissime pateat ex verbis quæ locum citatum immediate sequuntur, quibus nimirum fateris in eadem illa epistola per Leibnitium altera vice edita in Novis Litterariis citationem parenthesi inclusam esse omissam; unde sponte fluit Auctorem epistolæ non fuisse Auctorem parentheseos, sed hanc fuisse insertam ab eo qui schedam volentem 29 Julij edidit; possum itaque haberi pro Auctore Epistolæ, et tamen non haberi pro Scriptore elogii parenthetici. Interim quicquid sit, calumnia Hartsoekeri in te magis quam in me redundat, eam enim ex verbis tuis maligne detortis elicere conatur. Quid igitur faciendum statuas, ut innocentia in tutum collocetur apud eos qui Collectanea Desmaisons non viderunt, libentissime equidem ex te ipso intelligerem, si qua responsione me dignari volueris. Quod superest, te, Vir Nobiliss., rogatum volo nomine Celeb. nostri Scheuchzeri, vestræ Societatis Regiæ Socii, ut Filio ipsius, qui nunc Londini agit, te accendendi alloquendique copiam indulgeas; id namque in maxima laude sibi ponet, quod viderit summum Philosophorum et Mathematicorum Principem. Vale, et me Nominis tui Cultorem perpetuum amare perge. Dabam Basileæ, a. d. vi. Febr. CIOJCCXXIII.

No. XXI.

(Referred to in page 233.)

Brook Taylor, LL.D., the son of John Taylor of Bifrons House in Kent, was born on the 18th August 1685, and died on the 29th December 1731.

In 1701 he was admitted into St. John's College, Cambridge, where he entered upon the study of mathematics and natural philosophy. In 1708 he wrote his treatise "On the Centre of Oscillation." In 1712 he was elected a fellow of the Royal Society, and in the same year he presented to that body his paper "On the Ascent of Water between two Glass Planes." His most important works—his *Methodus Incrementorum*, and his treatise *On the Principles of Linear Perspective*, were published in 1715. In the following year he paid a visit to Count Remond de Montmort and the Abbé Conti in Paris, with the first of whom he maintained a friendly correspondence. He was chosen Secretary to the Royal Society on the 13th January 1714, an office which he resigned on the 21st October 1718. In the following letters he appears as one of the champions of Newton in the fluxionary controversy.

I.—LETTER FROM BROOK TAYLOR TO SIR ISAAC NEWTON.

"SIR,

"The great loss to our family of my good dear mother, has made it necessary for me to make haste home, and I find the circumstances of our family will not suffer me to be in town before the rising of the Royal Society; wherefore I am under the necessity to beg the favour of you, Sir, to excuse me for not attending you in Crane Court, and that you will be pleased to get M. Desaguliers, or some other person, to do the Secretary's business at the meetings of the Society; and I hope I shall another time have an opportunity of making the Society some amends for my present absence.

"Upon my coming to London on Tuesday night, I found a letter from Mr. Montmort, dated the 31st March, N.S., wherein he gives me the following account of what passed at the French Academy relating to D. Keill's paper, which it seems they don't care to print.

"Le plus grand nombre s'est opposé à faire imprimer le morceau de Mr. Keill dans les mémoires de l'Académie par la raison que Mr. Keill est étranger à l'Académie, et que cela est contre les Statuts. Je pris la parole, représentai 1° que le morceau est excellent; 2° que M. Newton est attaqué dans les mémoires par M. N^{as} Bernoulli qui non plus que Mr. Keill n'est pas Membre de L'Académie; 3° que s'il étoit jamais permis de faire exception à une règle générale, c'estoit en faveur d'un aussi grand homme que M. Newton. Je compte qu'il sera imprimé s'il est avoué et reconnu de Mr. Newton ou de Mr. Halley au nom de la Société Royale.¹

"These are Mr. Montmort's own words, which I thought it my duty to communicate to you, not knowing what sort of an account Mr. Fontenelle may have given in his letter to Dr. Halley.² Mr. Montmort, in all his letters to me, seems to take a particular pleasure in expressing the great respect he has for you, Sir; and in one of his last he tells me he has sent to me a hamper of champagne wine, and begs your acceptance of 50 bottles of it.³ I can send it from hence either by land carriage or by water, if you

¹ This letter is published in the *Contemplatio Philosophica*, pp. 84-88.

² See Edleston's *Correspondence*, &c., p. 187.

³ This is the wine mentioned in p. 385, as intended for Miss Barton.

will be pleased to let me know whither I shall direct it. I will send it as soon as it comes to my hand. Pray, Sir, do me the favour to make my most humble service acceptable to Mrs. Barton.—I am,

“ Sir,

“ Your most faithful and most obedient servant,

“ BROOK TAYLOR.

“ BIFRONS, near CANTERBURY,
22^d April 1716.

“ To Sir Is. NEWTON.”

2.—EXTRACT OF A LETTER FROM M. MONTMORT TO BROOK TAYLOR,¹
dated Jan. 22, 1717.¹

“ Pour moi je soutient icy et je l'ai toujours soutenu hautement que M. Newton a été maître du Calcul différentiel et intégral avant tout autre géomètre, et que dès l'année 1677 il sçavoit tout ce que les travaux de M. Leibnitz et M. Bernoulli ont découvert depuis.”

3.—LETTER FROM M. MONTMORT TO BROOK TAYLOR.

“ MONTMORT, ce 18 Dec^r. 1718.

“ Je suis très persuadé, Monsieur, que vous n'avez point eu dessein de vous faire honneur de ce qui n'étoit point à vous, et de vous l'approprier ; outre que vous avez l'esprit et le cœur trop élevé pour être capable d'une telle petitesse, vous êtes trop riche de votre propre fond pour avoir besoin du bien d'autrui. Je crois que quand vous avez donné au public vostre excellent livre *Methodus Incrementorum*, vous étiez peu instruit de l'histoire des nouvelles découvertes. Je croirois même que vous ne l'estes pas assez à présent pour un homme destiné comme vous à jouer un grand rôle parmi les Sçavants de ce siècle. Les connaissances historiques inutiles à la vérité pour la perfection de l'esprit sont absolument nécessaires à un auteur qui faute de les avoir court risque de porter des jugemens injustes, de bâtir sur le fond d'autrui contre son intention, de mal apprécier le mérite des auteurs, et enfin de se tromper dans de faits dont un lecteur sévère suppose qu'on est instruit parcequ'on devoit l'être. En voici quelques uns dont il est apropos que vous ayez connaissance.

“ Mr. Huygens est inventeur de la théorie de centres d'oscillations, et de percussion. M. Jacques Bernoulli l'a rendue plus claire, plus facile, et plus parfaite. Voyez les Mémoires de l'Académie en 1703 et 1704. M. J. Bernoulli ayant cru qu'on y pouvoit ajouter quelque chose, a donné en 1714 dans ces Mémoires un beau morceau sur cette matière. Je crois qu'il a donné un second dans les Actes de Leipsic. Je ne sçai quand, car je ne les ai pas ici. Il est vrai que M^{rs} Bernoulli ny M. Leibnitz n'ont point donné dans les journaux de Leipsic les analyses de la chaînette, de la courbure d'une voile enflée par le vent, et de celle que prend un linge pressé par le poid d'un fluide qu'il contient ; mais il me semble que les solutions qu'ils ont donnés de ces problèmes sont très justes. J'ai parmi

¹ This extract is published at the end of Keill's letter to Bernoulli.

mes vieux papiers des démonstrations de tout ce que M. Jac. Bernoulli a avancé en 1691 p. 288 de l'identité qu'il y a entre la chaînette et la courbe de la voile, et aussi entre la courbe du linge et l'élastique. Vous trouverez dans la nouvelle théorie de la manœuvre des vaisseaux publié en 1714 les analyses des courbes *velaria*, *catenaria*, *lintea*. Je n'ajouterai point que ces analyses couvrent depuis plus de 25 ans entre les mains de plusieurs géomètres de toutes nations ; à qui M. Jean Bernoulli a communiqué les leçons manuscrites qu'il avoit fait, étant à Paris pour M. Le M. de l'Hôpital. Toutes ces analyses à l'exception de celle de la courbe élastique s'y trouvent. Je les ai vu dans un manuscrit de ces leçons que le P. Reyneau tira en 1692 d'un ami de M. Bernoulli. Le fait est constant, et j'en suis témoin avec peut-être plus de cent personnes, mais je n'admets que les monuments publics telles qu'est l'impression.

“ Il y avoit quelque chose à redire à ce que M. Jac. Bernoulli avoit donné en 1694 touchant la courbure des ressorts. Il a perfectionné cette matière dans les mémoires de l'Académie de l'année 1705. Je me souviens dans ce moment que l'analyse des chaînettes se trouve dans la solution que M. Jac. Bernoulli a donné en 1701 de son problème des Isopérimètres. Il est vray Mr. que la solution que Mr. Jean Bernoulli a donné en 1706 dans les mémoires de l'Académie du prob. des Isopérimètres n'est pas exempte de faute. Il a eu le bonheur de s'en appercevoir le 1^{er}, et avant que d'estre relevé par d'autres. Vous en verrez une nouvelle et très belle solution dans les Actes de Leipsic au mois de Janvier de cette année. Sa méthode est fondé sur la considération de trois élémens contigus de la courbe au lieu qu'il n'en considéroit que deux dans celle qui a paru en 1706. Elle n'est presque point différente dans le fond de celle de Mons^r. Herman qui ne me plait pas moins. Elles sont toutes deux entées sur celle de feu M. Bernoulli. Il la regarde comme son chef-d'œuvre : c'est un morceau d'une grande force, et qui me paroît surpasser en difficulté toutes les productions de ce jour. Je sçai bon gré au pauvre défaut d'avoir tenu ferme à soupçonner et dire qu'il y avoit faut et paralogisme dans l'analyse de son frère, et de n'avoir pas lâché ces 50 ecus qui n'étoient pas bien gagnés.

“ Je ne sçai si vous sçavez que M. De la Hire en 1702 dans les Mémoires de l'Académie, et M. Herman dans les Journaux de Leipsic un peu de temps après, ont entrepris de déterminer la courbe que décrit un rayon de lumière passant dans notre Atmosphère. Je crois qu'il y a faute dans M. de la Hire. Je ne me souviens pas de ce qui m'a paru il y a quelques années de la solution de M. Herman ; vous en jugerez et de ce qu'ils disent sur la densité de l'Atmosphère.

“ J'ay été fort surpris de trouver ce qui suit dans votre lettre. ‘ As to the owning of any one as inventor or improver of the method, besides Sir Isaac Newton, I knew of none. I saw nothing anywhere that seemed to me an improvement upon what Sir Isaac had published. I was sensible that several had applied the method with good success, and understood pretty much of it ; but I always took Sir Isaac Newton not only for the inventor, but also for the greatest master of it.’ Je pense comme vous Mr. sur le mérite de Mr. Newton. Je parle toujours comme d'un homme au dessus des autres, et qu'on ne peut trop admirer. Mais je ne puis m'empêcher de combattre l'opinion où vous estes que le Public a reçu de Mr. Newton, et non de M. Leibnitz et Bernoulli les nouveaux calculs, et l'art de les faire servir à toutes les recherches qu'on peut faire en Géomé-

trie. C'est une erreur de fait. Il vaut mieux que moi qui n'ay là dessus aucune prévention, ni rien qui me porte à en avoir, qui fait profession d'estre votre amis, et qui le suis plus sans comparaison que des Géomètres Allemands que je n'ai jamais vu ; il vaut mieux, dis je, que je vous fasse remarquer la fausseté qu'un adversaire à qui vous donneriez avantage sur vous et qui vous reprocheroit avec apparence de vérité que votre zèle pour la gloire de votre nation vous rend partiel et vous fait oublier toutes les règles de l'équité. Je n'examinerai point ici les droits de M^{rs}. Newton et Leibnitz à la première invention du calcul différentiel et intégral. Je vous rapporterai quand vous voudriez le détail des réflexions qu'un long et sérieux examen m'a fourni, et j'espère que vous n'en serez pas mécontent. Je veux seulement vous faire remarquer qu'il est insoutenable de dire que M^{rs}. Leibnitz et Bernoulli ne sont pas les vrais et presque uniques promoteurs de ces calculs. Voici mon raisonnement, jugez en. Ce sont eux et eux seuls qui nous ont appris les règles de différentier et d'intégrer, la manière de trouver par ces calculs les tangentes des courbes, leur pointes d'inflexion et de rebroussement, leurs plus grandes, et leurs plus petites ordonnées, les développés les caustiques par réflexion, et par réfraction, les quadratures des courbes, les centres de gravité, ceux d'oscillation, et de percussion, les problèmes de la méthode inverse des tangentes, tels que celuy par ex. qui donne tant d'admiration à M. Huygens en 1693 *trouver la courbe dont la tangente est à la partie intercepté de l'axe en raison donné*. Ce sont eux qui les premiers ont exprimé des courbes mécaniques par les équations différentielles, à en abaisser les dimensions, et à les construire par les logarithmes, ou par des rectifications des courbes quand cela est possible ; et qui enfin par de belles et nombreuses applications de ces calculs aux problèmes les plus difficiles de la Mécanique tels que sont ceux de la chaînette, de la voile, l'élastique, de la plus viste descente, de la paracentrique, nous ont mis et nos neveux dans la voye des plus profondes découvertes. Ce sont là des faits sans réplique. Il suffit pour s'en convaincre d'ouvrir les journaux de Leipsic. Vous y verrez les preuves de ce que j'avance. Personne hors M. le M. de l'Hospital qu'on peut joindre en partie à ces Messieurs quoiqu'il ait été disciple de M. Jean Bernoulli, n'a paru avec eux sur la scène jusqu'en 1700 ou environs. Je compte pour rien ce que M. Carré en France et M. Moivre en Angleterre, de même M. Craige donnèrent dans ce temps ou peu auparavant ; tout cela n'étoit rien en comparaison de ce qu'on nous avoit donné dans les Actes de Leipsic. Il est vray Mr. que les Principes Math. de M. Newton ont paru en 1686 [1687] ; ce sçavant ouvrage peut donner lieu de croire que M. Newton sçavoit dès lors de ces calculs tout ce qu'on sçait aujourd'hui, M. Bernoulli même. Je ne veux pas disconvenir, et c'est une question à part. Mais il est sûr au moins que ce livre n'apprend rien de ces calculs, si ce n'est le lemme, 2^d page 250, 1^{ère} édit., mais vous sçavez qu'il ne contient que la 1^{ère} et plus simple règle de prendre les différences, ce que M. Leibnitz avoit fait avec plus d'étendue en 1684. Je dois ajouter que dans le 2^de volume de M. Wallis imprimé en 1693 on trouve plus au long les règles de ces calculs, mais quoyque ce morceau soit propre à nous donner une grande idée de ce qu'en sçavoit alors Mr. Newton il n'en apprend pas plus que l'on en trouvoit dans les journaux de Leipsic. On trouve en 1697 une solution de Mr. Newton du problème de la plus viste descente, mais comme il n'y a point d'analyse, et qu'on ne sçait point la route qu'il a suivie, cela ne touche

point à ma proposition qui est que depuis 1684, 1^{ère} date publique de la naissance du calcul différentiel et intégral, jusqu'en 1700 ou environ, où je suppose qu'il avoit acquis presque toute la perfection qu'il a aujourd'hui, personne n'a contribué à le perfectionner que M^{rs}. Leibnitz et Bernoulli, à moins qu'on n'y veuille joindre pour quelque part M. le M. l'Hospital à qui ils avoient de bonne heure révélé leur secrets. Qui apparemment en seroient encore pour tous les Géomètres d'aujourd'hui s'ils avoient voulu les tenir cachés à l'imitation de Mr. Newton, qui à mon avis a du avoir la clef de ceux là ou des pareils dès le temps qu'il a donné son fameux ouvrage, *Ph. Nat. Ppia Math.* On ne peut rien le plus beau ni de meilleur en son genre que le traité de Mr. Newton *De Quadratura Curvarum*, mais il est venu bien tard. La date de l'impression de cet ouvrage est fâcheuse, non pour Mr. Newton, qui a acquis tant de gloire que l'homme le plus ambitieux n'en pourroit désirer davantage, mais pour quelques Anglois qui semblent porter envie à ceux qui ont découvert et publié les 1^{ers} ces nouvelles méthodes qui ont portés si long la Géométrie."

LETTER FROM JAMES STIRLING TO SIR ISAAC NEWTON.

"SIR,

"I had the honour of your letter about five weeks after the date. As your generosity is infinitely above my merit, so I reckon myself ever bound to serve you to the utmost; and, indeed, a present from a person of such worth is more valued by me than ten times the value from another. I humbly ask pardon for not returning my grateful acknowledgements before now. I wrote to Mr. Desaguliers to make my excuse, while, in the meantime, I intended to send a supplement to the papers I sent; but now I'm willing they be printed as they are, being at present taken up with my own affair here, wherewith I won't presume to trouble you, having sent Mr. Desaguliers a full account thereof.

"I beg leave to let you know, that Mr. Nicholas Bernoulli proposed to me to enquire into the curve which defines the resistances of a pendulum, when the resistance is proportional to the velocity. I enquired into some of the most easy cases, and found that the pendulum, in the lowest point, had no velocity, and consequently could perform but one half oscillation, and then rest. Bernoulli had found that before, as also one Count Ricato, which I understood after I communicated to Bernoulli what occurred to me. Then he asked me how in that hypothesis of resistance a pendulum could be said to oscillate, since it only fell to the lowest point of the cycloid, and then rested. So I conjecture that his uncle sets him on to see what he can pick out of your writings, that may any ways be cavilled

against, for he has also been very busy in enquiring into some other parts of the Principles.

“I humbly beg pardon for this trouble, and pray God to prolong your daies, wishing that an opportunity should offer that I could demonstrate my gratefullness for the obligations you have been pleased to honour me with.

“I am, with the greatest respect, Sir,
“Your most humble and most obedient serv^t,

JAMES STIRLING.

“VENICE, 17 August 1719, N. St.

“P.S.—Mr. Nicholas Bernoulli, as he hath been accused by Dr. Keill of an ill-will towards you, wrote you a letter some time ago to clear himself. But having in return desired me to assure you, that what was printed in the *Acta Paris.* relating to your 10 Prop. lib. 2, was wrote before he had been in England, sent to his friends as his private opinion of the matter, and afterwards published without so much as his knowledge. He is willing to make a full vindication of himself as to that affair whenever you'll please to desire it. He has laid the whole matter open to me; and if things are as he informs me, Dr. Keill has been somewhat harsh in his case. For my part, I can witness that I never hear him mention your name without respect and honour. When he shewed me the *Acta Eruditorum*, where his uncle has lately wrote against Dr. Keill, he shewed me that the theorems there about quadratures are all corollarys from your Quadratures; and whereas Mr. John Bernoulli had said there, that it did not appear by your construction of the curve, Prop. 4, lib. 2, that the said construction could be reduced to logarithms, he presently shewed me Coroll. 2 of the said Proposition, where you shew how it is reduced to logarithms, and he said he wondered at his uncle's oversight. I find more modesty in him as to your affairs than could be expected from a young man, nephew to one who is now become head of Mr. Leibnitz's party; and, among the many conferences I've had with him, I declare never to have heard a disrespectful word from him of any of our country but Dr. Keill.”

LETTER FROM FONTENELLE TO SIR ISAAC NEWTON.

“MONSIEUR,

“Je suis chargé par L'Académie Royale des Sciences d'avoir l'honneur de vous remercier de la nouvelle Edition que vous avez envoyée de vos Principes des Mathématiques de la Philosophie Naturelle. Il y a déjà plusieurs années que cet excellent ouvrage est admiré dans toute l'Europe, et principalement en France, où l'on sait bien connaître le mérite étranger.

Mais présentement, Monsieur, que vous avez une place dans notre Académie, nous prétendons, en quelque façon que vous n'êtes plus étranger pour nous, et nos Savants qui ont quelque droit de vous appeler leur Confrère prennent une part plus particulière à votre gloire. On peut sans témérité vous prédire qu'elle sera immortelle par les deux Livres que vous avez publiés, où il brille de toutes parts un si heureux génie de découvertes, et où ceux-même qui savent le plus trouvent tant à apprendre.

“ L'Académie vous prie Monsieur de lui faire quelque fois part de vos nouvelles productions ainsi que font Messrs. Leibnitz, Bernoulli, et les autres Savants étrangers qu'elle a adoptés. Il n'est pas surprenant qu'elle cherche à se faire honneur de ce qu'elle vous possède.—Je suis,

“ Monsieur,

“ Votre très humble et très obéissant serviteur,

“ FONTENELLE,

“ à Paris, ce 4 Fév. 1714.”

(Referred to in page 235.)

LETTER FROM DR. DERHAM TO SIR ISAAC NEWTON.

“ UPMINSTER, ♀ Feb. 20, 1713.

“ MUCH HON^d S^r,

“ As I was perusing the *Commerc. Epist.* w^{ch} y^e R. S. honoured me with, it came into my mind, that in some of Mr. Collins's l^{rs} to Mr. Towneley of Lanc. (now in my hands), there was something relating to that subject; and looking over Mr. Towneley's papers, I found a long l^r of Mr. Collins's, giving a sort of historical account of the matter, That in Sept. . . . Mercator published his *Logar.*, one of w^{ch} he sent to Dr. Wallis, &c. . . . another to Mr. Barrow, who thereupon sent him up some papers of Mr. Newton (now his successor), by w^{ch}, and some other communications, &c., it appears y^e s^d method was invented some years before by Mr. Newton, and generally applied. . . . Then follows an account of your method, and of Mr. Gregorie's performance in y^t kind, with what Mr. Gregory had written to him about it in Feb. 1671, and Jan. 1672, &c.

“ There is a great deal more, too long to speak of; but if you think the papers may be of use to you, at your request I will bring them wⁿ I next come to London, to be looked over or transcribed; but I am engaged not to part with any of them out of my power. I have also divers of Mr. Sluse's l^{rs}, and other papers of his, from Rome and Leige, to Mr. Towneley, but they being in French, I cannot as yet give any account whether there be any thing relating to your matter in them. Not meeting you when I was last in town, I shall take this occasion to acquaint you y^t I have tried Mr. Huygens's glass of 122 feet at ♀, ♀, ♀, and ♂, and some fixt ✕; and I hope shortly to have a view of ♀ also. I believe it by far the best long

glass I ever looked through, representing these celestials very clear and well. But I can hardly think Mr. Huygens could see tollerably through it with the eye-glass accompanying it, w^{ch} is but 6 inches focus; I, therefore, make use of eye-glasses of a larger focus. I am not yet so well accommodated for strict observations with this glass as to tell you any thing of $\frac{1}{2}$ Sat., &c., for I am forced to raise a long ladder and send my man up with the glass. Neither have I a good eye-glass to my mind, only some spectacle-glasses. But would you, or some other of my friends that have interest enough, procure me a small Prebend, to enable me to be at charges without injuring my wife and children, I promise you I would stick at no charge to get an apparatus for this noble glass, to make it as serviceable to the R. S. as in me lies; and to accomplish some other matters also for their service. Be pleased to excuse my presumption thus upon your friendship and favour, w^{ch} I desire may be no otherwise troublesome to *you* then if any thing happens in your way, and you have no other friend capable of it, you would, for the service of the R. S. as well as myself, think of me, and at the same time pardon,

“Most Hon^d Sr,

“Your affectionately humble servant,

“WM. DERHAM.

“If you have any commands, direct to Upminster, near Rumford, Essex, by the general post.”

In another letter, which possesses no interest, dated May 11, 1714, he requests Newton to fulfil his promise of giving him his “castigations” for a third impression of his *Physico-Theology*.

No. XXV.

(Referred to in pages 242, 334.)

LETTER FROM POPE TO MR. CONDUITT.

“Sr,

“I make use of the liberty you gave me, of a free criticisme, in the inclosed; without any formalities, or asking an excuse from you in my turn. I think nothing can be more proper than the first part of your dedication, which relates to the author of the work: Whatever thoughts flow from *that*, or take rise from *that*, render your compliment to the Queen (in my opinion) the more graceful as well as the more just (and proper for you as a relation, and intrusted with so valuable a depositum.) As to what depends not on *that*, I would only wish you avoided as much as possible the common topicks of dedications and addresses: Your real subject (I mean both Sir Isaac Newton and Her Majesty), will shine of

themselves; and a shortness, a dignity, and plainness will become them. For instance I cannot but think, y^t after y^u have said, that *Sr Isaac carried arts and sciences in a few years farther than all others had in whole ages*; it flattens if not contradicts it, to add afterw^ds y^t *in the present reign they may be advanced to a much greater height*. I w^d omit that paragraph w^{ch} I have marked between two crosses x. It takes very much from the praise of Sr I. N., and I fear unjustly, to imagine that any Prince's reign can make Newtons, however it might *incourage or admire* them.

"I mean in general only that I w^d shorten those parts w^{ch} are mere panegyric, independent on the occasion the book and author give you: the character of sincerity w^{ch} y^u so rightly touch upon in the King, I w^d keep exactly as it is, and anything in short that is characteristical. I prefer (since your commands are, that I sh^d chuse what I like) the column on the right hand: only in one place I think what you say of the Queen's encouragement of arts, is almost a repetition of the same thing elsewhere. I have marked it by inclosing y^t passage with a line and two crosses x x. The rest I believe may stand.

"Upon the whole I really approve it; and you ought to pardon my freedom, since you caused it. If I am ever so much in the wrong, it will be at least an instance of my good intention. I am ashamed to be so particular in things of so little importance as my objections, which are indeed so very slight. But the apprehension that you might soon want the papers, and the consciousness that I could not be serviceable enough to you to excuse a longer delay, made me write this, rather than wait for an opportunity of talking with you. Methinks y^u should end the dedication with returning once more to Sir Isaac Newton. What little I've added, is only a hint to that effect. I am sincerely of opinion that your dedication is very just, and decent, and well judged. I c^d wish it were enlarged with some Memoirs and Character of him, as a private man. I doubt not his life and manners w^d make a great Discovery of Virtue and Goodness and Rectitude of heart, as his works have done of Penetration and y^e utmost Stretch of human knowledge.—I am, Sir, your most obedient humble servant,

"A. POPE.

"TWICKENHAM,
"Novr. 10th, 1727."

The following are the additions referred to in the letter, and written upon a separate leaf:—

"Y^r Majesty does not think these instructions and entertaining pursuits below your exalted station; and yourself a proof that the abstruser parts of them are not beyond y^e reach of y^r sex," &c.

"Formed by such models?

"That *liberty* and *knowledge* (as this glorious prospect gives us reason to hope) may be equally and jointly perpetuated; and that the bright *example* set in this reign by the Royal patrons of both, may be transmitted with the sceptre, to those of the same great line: to y^e end that this age may be as illustrious, and this nation as distinguished, for every other felicity and glory; as it is, and ever must be, for having been honoured with such a man as Sir Isaac Newton, is the most sincere prayer of,

"Madam, may it please y^r Majesty, &c."

No. XXVI.

(Referred to in page 271.)

In 1831, soon after the publication of my Life of Sir Isaac Newton, I received the following letter from Dr. Burgess, Bishop of Salisbury, who had distinguished himself by several learned and able works in defence of the doctrine of the Trinity.

“SIR,

“I beg your acceptance of the enclosed pages, which were occasioned by the perusal of your very interesting *Life of Sir Isaac Newton*, which I read with great pleasure, till I came to the statement of the contents of Sir Isaac's Dissertation on 1 John v. 7, and 1 Tim. iii. 16. I thought the restatement of his opinions on these subjects injurious to his memory, as he had expressly and anxiously suppressed them. I was desirous of counteracting the present abuse of Sir Isaac's authority by Socinians and Unitarians, but I was unwilling to deliver these pages to the public, without communicating them to yourself.—I am, SIR,

“With very sincere respect,

“Your obedient Servant,

“T. SARUM.”

The pages thus enclosed by the Bishop, bore the title of *Appendix on Sir Isaac Newton's suppression of his Dissertation on 1 John v. 7, and 1 Tim. iii. 18*. It consisted of ten printed pages, and contained the following criticisms on my work.

“The name of Sir Isaac Newton has been lately employed by Socinians and Unitarians, in opposition to the doctrine of the Trinity, on the authority of a Tract, which he anxiously and deliberately suppressed. Dr. Brewster, in his recent publication of the *Life of Sir Isaac Newton*, has, it is much to be regretted, done the same injustice to the memory of Sir Isaac by his restatement and revival of the general contents of the suppressed Dissertation on the controverted verse of St. John, and by omitting to notice Sir Isaac's suppression of the Tract. The preceding REMARKS on the general Tenour of the *New Testament* had hardly left the press, when I first met with Dr. Brewster's *Life of Sir Isaac Newton* in the 24th volume of the *Family Library*. The popularity of the work, of which Dr. Brewster's volume is a very interesting portion, has induced me to add this Appendix to my Remarks, in order to counteract, as far as may be, the injury done to the name of Sir Isaac Newton, and its influence on public opinion.”

“The revival and restatement of these abortive criticisms are injurious to the memory of the writer, because it omits to notice that the Tract which contains them was deliberately and anxiously suppressed.”—Pages 81, 82.

As soon as I received the preceding letter, and its enclosure, I informed the Bishop of the great mistake which he had committed, in charging me with having injured the memory of Sir Isaac Newton, by omitting to notice that he had suppressed his Tract. I directed his attention to page 274 of the work, in which I had not only mentioned the fact, but had even

printed at full length Newton's own letter to Locke suppressing his Dissertation. To this letter I received the following answer :—

“ PALACE, SALISBURY, Dec. 10, 1831.

“ SIR,

“ . . . I am still more sorry that I should have overlooked, or rather not have seen, at the time I printed my Appendix, the account in your work to which your letter directs me, and which I have since read, of the suppression of the Dissertation. The pages of your work (281-284) containing the statement of Sir Isaac Newton's opinions and paraphrase, *were shown to me by a friend*, and as they contained no allusion to the suppression of the Dissertation, I was led to suppose that you had altogether omitted to notice it. When I reprint my Appendix, I shall certainly correct my oversight.—I am, SIR,

“ Your obedient Servant,
“ T. SARUM.”

I am unwilling to characterize the incompatibility of the statements contained in these two letters, but having overlooked the offence at the time, I may now express my surprise, that after having committed such a gross error, Dr. Burgess never thought of correcting it, either by reprinting the few pages of his Appendix, or by inserting a fly leaf in his volume.

The charge of having injured Sir Isaac Newton, and of having produced, by “ the revival and restatement of his abortive criticisms,” an *influence on public opinion* which it was necessary for Dr. Burgess to counteract, is too ridiculous to require refutation. The Bishop himself, in his “ Tracts on the Divinity of Christ,”¹ has quoted from this very Dissertation, in order to show that it is not Antitrinitarian, and yet he denounces others for following his example. He has referred also, times without number, to the subject of Newton's Arian tendencies, and thus compelled his readers to peruse the very Dissertation of which he is afraid. Such an attempt to stifle the truths of history is of very rare occurrence. Dr. Horsley, the great champion of the Trinity, did not scruple to give importance to Newton's Dissertation, by publishing it along with the Principia ; and I should have betrayed the trust committed to me, had I not given an account of the theological writings of a man, who was described by one Bishop as “ knowing more of the Scriptures than them all,” and by another as having “ the whitest soul” he ever knew.

No. XXVII.

(*Referred to in page 276.*)

IRENICUM : OR ECCLESIASTICAL POLITY TENDING TO PEACE.

THESIS I.

“ The cities of the Israel before the Babylonian captivity were governed by elders, who sat in the gate of the city, and put the laws of Moses in

¹ He even says that Newton wrote against 1 John v. 7, *as other orthodox persons have done.* Page xxi. *Tracts*, &c. Lond. 1820.

execution, and had a place of worship in or near the gate, and sometimes a high place for sacrificing upon a neighbouring hill.—See Deut. xix. 12, and xxi. 19, 20, 21, and xxii. 18, 19, and xxv. 7, 8, and Ruth iv. 2, and Josh. xx. 4, and Psal. vii. 4-8. And in this sense it is said that the gates of hell, that is the magistrates in the gates of idolatrous cities, shall not prevail against the true Church of Christ.

THESIS 2.

“The government of the Jewish Church, being dissolved by the Babylonian captivity, was restored by the commission of Artaxerxes Longimanus, king of Persia, to Ezra, authorizing him to set magistrates and judges to judge the people who knew the laws of God, and to teach them who knew them not, and to execute judgment upon those who would not do the Law of God and the law of the king, whether it were unto death or to banishment, or to confiscation of goods, or to imprisonment.

“For the forming of this government being left to the discretion of Ezra, it may be presumed that he would pursue the ancient form of Jewish government so far as it was practicable.—See Ezra x. 14.

THESIS 3.

“The government then set up by Ezra was by courts of judicature, composed of elders; the highest court being the Sanhedrim, composed of 70 elders, originally instituted by Moses; and the second court being composed of 23 elders in the outward gate of the temple; and the other courts sitting in the synagogues of the cities, and being composed of the elders of the city, not more in number than 23, not fewer than three.—See Matt. x. 17, and xxiii. 34; Luke xii. 11, and xxi. 12.

THESIS 4.

“The government set up by Ezra continued till the days of Christ, and was then extended over all the Roman Empire; and the Jews, by the permission or connivance of the Romans, erected synagogues wherever they were sufficiently numerous to do it; and the elders of cities were called rulers of their synagogues.—See Acts xv. 21, Matt. x. 17, and xxiii. 34, and Luke xii. 11, and xxi. 12.

THESIS 5.

“The same government continued among the converted Jews of the circumcision in the regions of Phœnicia, Syria, &c., till the end of the fourth century, or longer, and the chief ruler of the synagogue was called by them the Prince of the Synagogue.

THESIS 6.

“The same government was propagated from the Jews to the converted Gentiles, the name of synagogues being changed to that of churches, and the name of Chief Rulers and Princes of the Synagogues unto that of Presi-

dents and Bishops, the Bishop being the President of the Council of Elders, called in the Greek Presbyters, and the Presbyters in the Council being at length called Prebendaries, from the allowances made to them out of the revenues of the Church for their attendance. But the name of churches was of a larger extent, being given also to single assemblies in private houses, and other places not attended with a Board of Elders, and collectively to the churches of a kingdom or nation, or in the whole world.

THESIS 7.

“It is therefore the duty of bishops and presbyters to govern the people according to the laws of God and the laws of the king, and in their councils to punish offenders according to those laws, and to teach those who do not know the laws of God; but not to make new laws in the name of either God or the king.

THESIS 8.

“The Church is constituted, and her extent and bounds of communion are defined by the laws of God, and these laws are unchangeable.

THESIS 9.

“The laws of the king extend only to things that are left indifferent and undetermined by the laws of God, and particularly to the revenues and tranquillity of the Church, to her courts of justice, and to decency and order in her worship; and all laws about things left indifferent by the laws of God ought to be referred to the civil government.

THESIS 10.

“The king is supreme head and governor of the Church in all things indifferent, and can nominate new bishops and presbyters to succeed in vacant places, and deprive and depone them whenever they may deserve it.

THESIS 11.

“The being of the Church doth not depend upon an uninterrupted succession of bishops and presbyters for governing her; for this succession was interrupted in the time of the Babylonian captivity until Ezra, by the commission of Artaxerxes, appointed new governors. And therefore if it should be again interrupted, the Christian people, by the authority or leave of the king, may restore it. The Christian church was also in being before there was a Christian synagogue.

THESIS 12.

“All persons baptized are members of Christ's body called the Church, even those who are not yet admitted into the communion of the synagogue of any city. For all members circumcised were members of the Church of the Jews in the time of the Babylonian captivity before Ezra restored their polity. And in the days of Ahab, when there remained only 7000 in Israel

who had not bowed the knee to Baal, these were the true Church of God, though without an external form of government; and the worshippers of Baal under their external form of government were a church of idolaters, such a church, as in scripture, is called the synagogue of Satan, who say they are Jews and are not, a false church with regard to the God whom they worshipped. And the three thousand baptized by Peter were a Christian church, though they had not yet a bishop, or presbyter, or synagogue, or form of government.

THESIS 13.

“By imposition of hands men are admitted into the communion of the synagogue of a city, and by excommunication they are deprived of that communion, and return into the state they were in by baptism alone, before they were received into communion by imposition of hands, except the sin for which they were excommunicated; and by new imposition of hands they may be received into communion again without new baptism, and therefore by excommunication they do not lose the privilege or benefit of baptism.

THESIS 14.

“Men are not to be excommunicated without breaking one or more of the articles upon which they are admitted into communion. For this would be to alter the bounds of communion settled by the laws of God in the beginning of the Gospel.

THESIS 15.

“To impose any article of communion not imposed from the beginning is a crime of the same nature with that of those Christians of the circumcision who endeavoured to impose circumcision, and the observation of the law upon the converted Gentiles. For the law was good if a man could keep it, but we were to be saved not by the works of the law, but by faith in Jesus Christ; and to impose those works as articles of communion, was to make them necessary to salvation, and thereby to make void the faith in Jesus Christ. And there is the same reason against imposing any other article of communion which was not imposed from the beginning. All such impositions are teaching another gospel.

THESIS 16.

“To refuse communion with any church or synagogue merely upon account of the laws of the king in matters indifferent, unless these laws are imposed not merely as laws of the civil government, but as articles of religion and communion, is disobedience to the king, and schism in relation to the Church.

THESIS 17.

“To distinguish churches from one another by any difference in customs or ceremonies, or in other laws than the laws of God, is improper, and tends to superstitions. And if the distinction occasions a breach of communion, the person insisting upon it as a matter of religion is guilty of the

schism. For the distinction being taken from things which are only of human authority and external to religion, ought not to be considered as a part of religion, nor to enter into the definition of a Church.

THESIS 18.

“The fundamentals or first principles of religion are the articles of communion taught from the beginning of the Gospel in catechising men in order to baptism and admission into communion; namely, that the catechumen is to repent and forsake covetousness, ambition, and all inordinate desires of the things of this world, the flesh, and false gods called the devil, and to be baptized in the name of one God, the Father, Almighty, Maker of Heaven and Earth, and of one Lord Jesus Christ, the Son of God, and of the Holy Ghost.—See Heb. v. 12, 13, 14, and vi. 1, 2, 3.

THESIS 19.

“After baptism we are to live according to the laws of God and the king, and to grow in grace and in the knowledge of our Lord Jesus Christ, by practising what they promised before baptism, and studying the Scriptures, and teaching one another in meekness and charity, without imposing their private opinions, or falling out about them.

THESIS 20.

“The commission to teach and baptize was given to the Apostles as the disciples of Christ, and to their disciples, and the disciples of their disciples, to the end of the world, there being no bishops or presbyters or church government yet instituted among the Christians. But after the institution of governments, the governors appointed men to catechise and baptize, except in cases of necessity, where the original right returned. For Tertullian has told us that in his days the rule was, *In casu necessitatis quilibet laicus tingit.*”

These *Theses* were called *Positions* in the original MS., but the term *Thesis* was afterwards substituted. We have placed them according to their number, and not as in the manuscript.

No. XXVIII.

(Referred to in page 279.)

QUÆRIES REGARDING THE WORD *ἁποστόλιος*.

QUÆRE 1. Whether Christ sent his apostles to preach metaphysics to the unlearned common people, and to their wives and children?

QUÆRE 2. Whether the word *ὁμοούσιος* ever was in any creed before the Nicene; or any creed was produced by any one bishop at the Council of Nice for authorizing the use of that word?

QUÆRE 3. Whether the introducing the use of that word is not contrary to the Apostles' rule of holding fast the form of sound words?

QUÆRE 4. Whether the use of that word was not pressed upon the Council of Nice against the inclination of the major part of the Council?

QUÆRE 5. Whether it was not pressed upon them by the Emperor Constantine the Great, a catechumen not yet baptized, and no member of the Council?

QUÆRE 6. Whether it was not agreed by the Council that that word should, when applied to the Word of God, signify nothing more than that Christ was the express image of the Father? and whether many of the bishops, in pursuance of that interpretation of the word allowed by the Council, did not, in their subscriptions, by way of caution, add *τουτ' ἐστὶν ὁμοούσιος*.

QUÆRE 7. Whether Hosius (or whoever translated that Creed into Latin) did not impose upon the Western Churches by translating *ὁμοούσιος* by the words *unius substantiæ*, instead of *consubstantialis*? and whether by that translation the Latin Churches were not drawn into an opinion that the Father and Son had one common substance, called by the Greeks *Hypostasis*, and whether they did not thereby give occasion to the Eastern Churches to cry out, presently after the Council of Sardica, that the Western Churches were become Sabellian?

QUÆRE 8. Whether the Greeks, in opposition to this notion and language, did not use the language of three Hypostases, and whether in those days the word Hypostasis did not signify a substance?

QUÆRE 9. Whether the Latins did not at that time accuse all those of Arianism who used the language of three Hypostases, and thereby charge Arianism upon the Council of Nice, without knowing the true meaning of the Nicene Creed?

QUÆRE 10. Whether the Latins were not convinced, in the Council of Ariminum, that the Council of Nice, by the word *ὁμοούσιος*, understood nothing more than that the Son was the express image of the Father—the acts of the Council of Nice were not produced for convincing them. And whether, upon producing the acts of that Council for proving this, the Macedonians, and some others, did not accuse the bishops of hypocrisy, who, in subscribing these acts, had interpreted them by the word *ὁμοιούσιος* in their subscriptions?

QUÆRE 11. Whether Athanasius, Hilary, and in general the Greeks and Latins, did not, from the time of the reign of Julian the Apostate, acknowledge the Father, Son, and Holy Ghost to be three substances, and continue to do so till the schoolmen changed the signification of the word hypostasis, and brought in the notion of three persons in one single substance?

QUÆRE 12. Whether the opinion of the equality of the three substances was not first set on foot in the reign of Julian the Apostate, by Athanasius, Hilary, &c.?

QUÆRE 13. Whether the worship of the Holy Ghost was not first set on foot presently after the Council of Sardica?

QUÆRE 14. Whether the Council of Sardica was not the first Council which declared for the doctrine of the Consubstantial Trinity? and whether the Council did not affirm that there was but one hypostasis of the Father, Son, and Holy Ghost?

QUÆRE 15. Whether the Bishop of Rome, five years after the death of Constantine the Great, A. C. 341, did not receive appeals from the Greek Councils, and thereby begin to usurp the universal bishopric?

QUÆRE 16. Whether the Bishop of Rome, in absolving the appellants from excommunication, and communicating with them, did not excommunicate himself, and begin a quarrel with the Greek Church?

QUÆRE 17. Whether the Bishop of Rome, in summoning all the bishops of the Greek Church to appear at the next Council of Rome, A. C. 342, did not challenge dominion over them, and begin to make war upon them for obtaining it?

QUÆRE 18. Whether that Council of Rome, in receiving the appellants into communion, did not excommunicate themselves, and support the Bishop of Rome in claiming appeals from all the world?

QUÆRE 19. Whether the Council of Sardica, in receiving the appellants into communion, and decreeing appeals from all the churches to the Bishop of Rome, did not excommunicate themselves, and become guilty of the schism which followed thereupon, and set up Popery in all the West?

QUÆRE 20. Whether the Emperor Constantius did not, by calling the Council of Millain and Aquileia, A. C. 365, abolish Popery? and whether Hilary, Lucifer, . . . were not banished for adhering to the authority of the Pope to receive appeals from the Greek Councils?

QUÆRE 21. Whether the Emperor Gratian, A. C. 379, did not, by his edict, restore the universal bishopric of Rome over all the West? and whether this authority of the Bishop of Rome hath not continued ever since?

QUÆRE 22. Whether Hosius, St. Athanasius, St. Hilary, St. Ambrose, St. Hierome, St. Austin, were not Papists?¹

No. XXIX.

(Referred to in page 289.)

DE METALLO AD CONFICIENDUM SPECULUM COMPONENTO ET FUNDENDO.

“*R* cupri partes 11 vel 12, stanni optimi partes 4, arsenici albi partem 1. Cupro liquefacto injiciatur arsenicum, et cum baculo ligneo bene commisceantur agitando. Dein Stannum etiam in frustra divisum injiciatur, et massa iterum agitur celeriter, atque omnibus sic bene commistis in formam absque mora infundantur.

“*Nota* 1. Quod Stannum celerrime liquefiat, et massam deinde per fumos suos porosam reddat si diutius stet super ignem ut intentius incalcescat.

¹ The Quæries after Number 14 are not numbered in the original.

"2. Massa itaque si iterum fundenda est non debet plusquam ad liquefactionem incalescere.

"3. Potest cuprum antequam miscetur cum stanno, purgari liquefaciendo et injiciendo in 12 uncias cupri liquefacti, primo unciam unam arsenici ac duas tresve uncias antimonii crudi, deinde tres vel quatuor uncias salis nitri per vices, donec totus sal deflagraverit. Tunc massa frige facta abjiciatur scoria salinosa, et iterum fundatur metallum injicianturque novi salis nitri duæ tresve uncia per vices, donec totus deflagraverit, ut prius; eritque satis depuratum si sal supernatans post refrigerium albus exierit; sin secus, tertio liquefaciendum est cum sale. Sed interea summe cavendum est a fumis arsenici.

"Ex cupro sic purgato componi potest metallum cum arsenico et stanno ut supra; sed compositio habebitur fortius reflectens et (quantum conjicio) magis resistens ærugini si onisso arsenico injiciatur ad duodecim partes cupri liquefacti, primo una pars Zineti seu Margaritæ albæ et una pars reguli antimonii per se sine $\frac{1}{2}$ facti, deinde quatuor partes stanni ut supra. Signum optimæ compositionis est ut metallum instar vitri læve appareat ubi frangitur.

"5. Si metallum in formam infusum, inter refrigerandum in fragmenta sponte dissiliat, id arguit nimium esse stanni pro quantitate cupri. Quare tunc aliquantulum novi cupri, puta duodecima pars totius massæ per se pendenda est huic fuso injicienda reliqua massa diffracta.

"5. Metallum sic formatum debet esse satis crassum ne inter terendum et poliendum vel minime flecti queat. Majori enim ἀκρίβεια debent metalla ad usus opticos formari quam vitra. Quæ ego pro tubo septem fere digitorum fudi, erant quadrantem digiti circiter crassa, duosque digitos lata. Primò quidem formabam tenuiora, et minus lata, sed ex illis nihil perfectum construere potui."

No. XXX.

(In reference to pages 306, 307.)

ALTERATIONS AND ADDITIONS MADE IN THE THIRD EDITION OF THE PRINCIPIA.

After perusing Pemberton's letters to Newton, I drew up a list of the additions made to the *Principia* in the third edition, and of the more important alterations upon the second, in so far as they could be gathered from the letters. It occurred to me, however, that some of his distinguished successors in Cambridge must have had occasion to notice these additions and alterations, and I accordingly applied to J. C. Adams, Esq., of Pembroke College, who has obligingly favoured me with the following interesting communication:—

"I have made no regular comparison of the several editions of the *Principia*, except with reference to some special points. Some of the differences, however, which I have noticed between the 2d and 3d editions, I will mention below.

“The proof that Newton was acquainted with the true principles of calculating the motion of the moon’s apogee, and that he had actually determined that motion to a considerable degree of approximation, is supplied by a scholium which follows prop. 35 of the 3d book *in the first edition*. In the subsequent editions this scholium is greatly enlarged, but the evidence on the point above mentioned is unfortunately omitted.

“In the correspondence between Newton and Cotes, published by Mr. Edleston, I can find no allusion to the old scholium.¹

“Many have supposed that Newton intended to find the motion of the moon’s apogee in the 2d corollary to prop. 45 of his 1st book, p. 141, but this is a complete mistake. In the 1st and 2d editions no reference whatever is made to the moon in this corollary; and in the 3d edition is added the remark, ‘Apsis lunæ est duplo velocior circiter,’ for the express purpose of pointing out that the corollary is not applicable to the case of the moon. In fact, the disturbing force, the effect of which is found in this corollary, is only *one part* of the sun’s disturbing force on the moon, and to the other part the method of the corollary is plainly inapplicable.

“To the 2d edition of the Principia, at page 419 (451 of 3d), there is added a very elegant proposition by Machin and Pemberton, respecting the motion of the moon’s node. It may be thus stated:—The mean rate of motion of the sun from the moon’s node is a mean proportional between the rates of motion with which the sun separates from the node when in syzygy and quadrature respectively. I may mention that when stated in this form, the proposition is equally applicable to the motion of the moon’s apogee. (See p. 553, bottom.)

“I will now mention some of the other changes which I have noticed in the 3d edition.

“Lemma 11, Cor. 4, p. 31, 2d edit. last line, ‘quamque alias sesquialteram dicunt,’ is omitted in 3d edit.

“Prop. 4, Cor. 1, p. 38, two lines, from ‘centripetæ sunt’ to ‘in ratione,’ are omitted.

“Cor. 2, p. 39, one and a half line, from ‘centripetæ sunt’ to ‘in ratione,’ is omitted.

“Prop. 8, p. 44, line 14, ‘Circulo’ is changed into ‘Semicirculo;’ and in the scholium, p. 45, ‘Et simili argumento corpus movebitur,’ is changed into ‘Et argumento haud multum dissimili corpus inveniatur movere.’

“Prop. 10, Cor. 2, p. 47, for ‘ad axes alteros,’ is substituted ‘ad idem punctum axis communis.’

“At the end of corollary 1, prop. 13, p. 59, 53,² is added, ‘Eademque velocitate.’³

“Prop. 14, Cor. p. 54, after ‘ $QT \times SP$,’ is added, ‘quæ dato tempore describitur.’

“Prop. 17, page 57, line 8, ‘Sit istud L,’ is changed into ‘Sit L conic sectionis latus rectum.’

“At the end of prop. 17, p. 64, 57, is added the sentence, ‘Nam si corpus,’ &c.⁴

¹ There is a slight allusion to it in the *Correspondence*, &c., p. 109.

² The *first* number for the page is the number in the 3d edition, and the *second* number is that in the 2d edition.

³ Suggested by Pemberton.

⁴ Id.

“Scholium to prop. 21, p. 65, at the beginning the sentence ending with ‘potest’ is added.

“Near the end of the scholium to prop. 31, p. 112, 104, *Ward’s* name is omitted.

“At the end of corollary 19 to prop. 66, p. 182, 167, is added, ‘Nisi quatenus motus fluendi,’ &c.

“At end of corollary 20 to same prop., p. 183, 168, are added 15 lines, ‘Nisi quod loca maximarum,’ &c.

“In book ii. p. 246, 226, the Leibnitz scholium is replaced by another.

“To prop. 13, p. 269, 250, a short scholium is added.

“To prop. 14, p. 274, 252, a scholium is added.

“At end of scholium to prop. 22, p. 292, 270, the sentence is added, ‘Cæterum per experimenta constat,’ &c.

“At the end of corollary 3, prop. 29, p. 303, 280, the clause, ‘Quæ et generalior sit,’ &c., is omitted.

“Page 292, 2d edit., ‘Denique cum receptissima Philosophorum ætatis hujus,’ is changed into ‘Denique cum nonnullorum,’ &c.

“Page 314, Lemma 5, the second paragraph is added, ‘Hæc ita,’ &c.

“Page 316, Cor. 1, ‘duplicata’ is omitted in the 3d line.

“Page 317, prop. 39, a scholium of 7 lines is added.

“Page 325, Exp. 13, ‘Mense Junio 1710,’ is added.

“In book iii., at the end of Regula iii. p. 389, 358, is added, ‘Attamen gravitatem corporibus essentialem esse minime affirmo,’ &c. Also Regula iv. is added.

“Phenom. i., p. 390, 359, Pound’s observations of the elongations of Jupiter’s satellites are given. The account of phen. ii. is enlarged. To phen. iii. is added, ‘Hos enim luce a sole,’ &c.¹

“Phen. iv., the periodic times of the planets are added.

“Prop. 4, p. 397, 364, Huygens’s determination of the force of gravity by means of the pendulum, is cited at greater length, &c. A scholium is added.

“Prop. 5, p. 399, 365, a short scholium is added.

“Prop. 8, corollary 1, p. 406, 370, the masses of the planets are changed.

“Prop. 10, p. 407, 373, ‘Ostendimus utique in scholio,’ &c., is added.

“Prop. 17, p. 411, 377, a short paragraph is added on the rotation of Jupiter and of the Sun. Also reference is made to Mercator and Cassini.

“Prop. 19, p. 413, 378. Some changes are made in the account of measurements of degrees; and in the 3d edit., Pound’s measures of the polar and equatorial diameters of Jupiter are given.

“Prop. 20, p. 418. A paragraph in p. 384 of 2d edit., ‘Hæc ita se habent,’ &c., is omitted; as is also another in p. 387, on the figure of the earth, derived from the measures of Picart and Cassini.

“Prop. 24, p. 424, 390, ‘Vis solis vel lunæ,’ &c., is added.²

“Scholium to prop. 35, of 3d edit. The paragraph ‘Si computatio accuratior desideretur,’ &c., in p. 425 of 2d edit., is omitted.

“Two corollaries are added to prop. 37, p. 471 of 3d edit.

“The fig. to Lemma 10, p. 490, 431 of 3d edit., is simpler than in the former editions.

“In p. 497 of 3d edit., the places of stars compared with the comet of 1680, are given according to Pound.

¹ Suggested by Pemberton.

² Id.

“ Prop. 42, p. 523, of 3d edit., Bradley’s observations of the comet of 1723 are given. A paragraph at the end of this prop. at p. 481 of edit. 2, attributing the acceleration of the moon’s motion to an increase of the mass of the earth, due to the condensation of vapours from the interplanetary spaces, is omitted in the 3d edit.

“ Many of the above changes and additions are very trifling, but I thought I might as well mention what I had noted.”

From the letters of Pemberton, I have collected the following additions and alterations, which are not mentioned by Mr. Adams. The pages are numbered as in the second edition.

- Page 9, line 14, *vas* placed after *postquam* at Pemberton’s request.
 „ 17, after *Lemmate 23, ejusque corollario* is added. Pemb.¹
 „ 19, line 10, after *retardantur*, a whole page nearly is added on the fall of heavy bodies; and for *hujus ætatis*, in line 14, is substituted *ætatis superioris*. Newton had made it *ætatis novissimæ*, but Pemberton says that *superioris* is Ciceronian.
 „ 20, line 16, after *corpus A*, we read (*ut ita dicam*) *in chordam arcus T A quæ velocitatem ejus exhibet, ut habeatur*, &c. Line 10 from bottom, *quiescens* added after *corpus B*. Pemb.
 „ 42, Cor. 3 is considerably changed at Pemberton’s desire.
 „ 46, line 4, *aliæ* inserted after *diametri*. Pemb.
 „ 51, line 7, *opposita* substituted for *conjugata*. Pemb.
 „ 51, 52, the diagrams greatly simplified. Pemb.
 „ 59, 60, Pemberton suggests a change on Prop. 17, which is not adopted.
 „ 64, line 16, after *Positione* three new lines are added in place of the last seven lines of *Cas. 1*. *Cas. 2* is also changed. Pemb.
 „ 79, a paragraph of six lines is added to Prop. 24, by Newton; but Pemberton proposes to have the leaf cancelled, and demonstrates, at some length, the truth of the paragraph which he wishes to substitute. See this Volume, p. 306.
 „ 87, lines 14 to 18 slightly changed. Pemb.
 „ 147, lines 13-15 altered by Pemberton.
 „ 249, Cor., two lines, ‘*Si centro C, &c.*’ are added at the beginning.
 „ 299, line 14, a slight alteration by Pemberton.
 „ 300, par. 2. See p. 155, *note*.
 „ 303, line 16 from bottom, *finge* is substituted for *concipe*.
 „ 305, line 14, after *debet*, the paragraph is greatly enlarged.
 „ 321, the second paragraph of Exp. 3 is greatly altered by Pemberton.
 „ 326, after the table, there is inserted an account, occupying two pages, of Desaguliers’ experiments in 1719. In the fine paper copy of the third edition, the word *ambientis* following *concave*, in the third line of the Additions, is struck out. See Horsley, *Newtoni Opera*, tom. ii. p. 427, *note*.
 „ 333, line 21, at *expandent*, Pemberton adds an explanatory note.

¹ The word *Pemb.* indicates that the alteration was made at the suggestion of Pemberton.

- Page 364, line 4 from bottom, after *revolvantur*, is inserted *manente lege gravitatis*.
- „ 367, line 5, after *proxime*, the words *uti calculis quibusdam initis*, are changed into *uti calculo quodam inito*.
- „ 376, Pemberton proposes to leave out the last sentence of the page *Et hi motus*, &c., but it was not done.
- „ 376, Prop. 14, Pemberton proposes to alter Cor. 1, but it was not done.
- „ 377, the whole of Prop. 17 is new, and greatly enlarged.
- „ 378, Prop. 19 is greatly changed. A paragraph of five lines, and placed at the beginning of the Proposition about Norwood's measurement of a degree, is new. The first paragraph in the 2d edit. is greatly altered.
- „ 379, the first paragraph is altered.
- „ 381, the two last paragraphs are greatly changed, and Pound's measures of Jupiter's oblateness are given in a table followed by two new paragraphs.
- „ 384, paragraph first, and the three last lines of paragraph second, omitted at Pemberton's suggestion.
- „ 386, 387, more than a page is omitted, and a large paragraph "*Virga ferrea*," &c., added. Pemb.
- „ 389, line 3, *a prioribus Astronomis non observate* substituted for *nondum observate*.
- „ 389, line 32-34, Pemberton suggests "a brief hint at the principle whence the precept contained in this line was deduced," but it is not given.¹
- „ 390, line 19, an additional reference is made to the new Cor. 20, Prop. 66, Lib. 1. Pemb.
- „ 415, at the end of this page is added a scholium with Machin's two Propositions on the motion of the moon's nodes. Pemberton suggested the reference to what had been done in his *Epistola ad Amicum de Cotesii Inventis*, pp. 6 and 7.
- „ 427, line 2, "*25472 ut supra in Prop. 19*," is substituted for "*85820*;" and in line 8, "*85472*," for "*85820*."
- „ 430, 431, the latter half of Cor. 7 is greatly altered.
- „ 433, the diagram and letters are altered. Pemb.
- „ 464, line 23, *fere* is omitted. Pemb.
- „ 467, line 7, Pemberton says that this is inconsistent with *Optics*, Qu. 11, but no change is made.
- „ 469, line 23, and 471, lines 27, 28, objected to by Pemberton, but not changed.
- „ 472, Pemberton criticises the explanation of the ascent of vapour from comets' tails, and proposes to substitute *Sectionibus Conicis* for *Ellipticis*, but no change is made.
- „ 474, line 17, *Lusitania* for *Portugallia*. Pemb.

¹ If Newton had complied with Pemberton's suggestion, all the difficulties connected with the motion of the moon's apogee would have been avoided. The paragraph to which Pemberton's suggestion relates, viz., "*Diminui tamen debet motus Augis sic inventus in ratione 5 ad 9 vel 1 ad 2 circiter, ob causam quam hic exponere non vacat*," clearly implies that Newton knew the reason.

Page 481, Before the paragraph beginning line 7-19, *Vapores*, &c., mentioned by Mr. Adams, is inserted an account, occupying a page, of the great star in Cassiopeia, seen in November 1572, by Cornelius Gemma. The paragraph beginning with *Vapores*, and ending with *Migrare*, immediately follows it; but the last paragraph, beginning with *Decrescente*, is omitted.

In place of omitting, as he has done, the long paragraph, "Si computatio," as in the Scholium, to Prop. 35, lib. iii. pp. 415 and 463 of third edition, Sir Isaac drew it up in a different form, which I find written as follows on the back of one of Pemberton's letters, without a date:— "Ut radius ad sinum distantie Lunæ a Sole ita angulus quidam Q ad Variationem secundam si Lunæ lumen augetur, addendam si diminuitur. Sic habebitur . . . longitudo Lunæ Angulus vero Q ex observationibus determinandus est. Et interea pro eodem usurpari potest angulus 1' 45" donec accuratius determinetur." "It does not appear," says Mr. Adams, to whom I sent the paragraph, "why it was not inserted, as it describes what is now called the Parallaxic inequality, and the co-efficient given is not far from the truth. Owing to the want of the paragraph, the process of finding the moon's longitude terminates very abruptly."

No. XXXI.

(Referred to in pages 317, 321.)

OBSERVATIONS ON THE FAMILY OF SIR ISAAC NEWTON.

In the year 1705, Sir Isaac Newton gave into the Herald's Office an elaborate pedigree, stating, upon oath, *that he had reason to believe* that John Newton of Westby, in the county of Lincoln, was his great-grandfather's father, and that this was the same John Newton who was buried in Basingthorpe Church on the 22d December 1563. This John Newton had four sons, John, Thomas, Richard, and William Newton of Gunnerly, the last of whom was great-grandfather to Sir John Newton, Bart. of Hather. Sir Isaac considered himself as descended from the eldest of these, *he having, by tradition from his kindred ever since he can remember, reckoned himself next of kin (among the Newtons) to Sir John Newton's family.*

The pedigree, founded upon these and other considerations, was accompanied by a certificate from Sir John Newton of Thorpe, Bart., who states that he had heard his father speak of Sir Isaac Newton *as of his relation and kinsman*; and that *he himself believed that Sir Isaac was descended*

¹ In this letter Pemberton calls Newton's attention to lines 24, 25, 26, 27 of page 341, and asks him to compare them with the second paragraph of the Scholium to Prop. 34. Book ii. p. 300; "for," he says, "if what is inserted in these lines before us be universally true, without any restriction, how can what is delivered in that paragraph be of any use in the forming of ships?"

from John Newton, son to John Newton of Westby, but knoweth not in what particular manner.

The pedigree of Sir Isaac, as entered at the Herald's Office, does not seem to have been satisfactory either to himself or to his successors, as it could not be traced with certainty beyond his grandfather; and it will be seen from the following interesting correspondence, that, upon making farther researches, he had found some reason to believe that he was of Scotch extraction.

EXTRACT OF A LETTER FROM THE REV. DR. REID OF GLASGOW TO
DR. GREGORY OF EDINBURGH, DATED MARCH 14, 1784.

"I send you on the other page an anecdote respecting Sir Isaac Newton, which I do not remember whether I ever happened to mention to you in conversation. If his descent be not clearly ascertained (as I think it is not in the books I have seen), might it not be worth while to inquire if evidence can be found to confirm the account which he is said to have given of himself? Sheriff Cross was very zealous about it when death put a stop to his inquiries.

"When I lived in Old Aberdeen above twenty years ago, I happened to be conversing over a pipe of tobacco with a gentleman of that country, who had been lately at Edinburgh. He told me that he had been often in company with Mr. Hepburn of Keith, with whom I had the honour of some acquaintance. He said that, speaking of Sir Isaac Newton, Mr. Hepburn mentioned an anecdote, which he had from Mr. James Gregory,¹ professor of Mathematics at Edinburgh, which was to this purpose:—

"Mr. Gregory being at London for some time after he resigned the mathematical chair, was often with Sir Isaac Newton.² One day Sir Isaac said to him, 'Gregory, I believe you don't know that I am connected with Scotland?' 'Pray how, Sir Isaac?' said Gregory. Sir Isaac said he was told that his grandfather was a gentleman of East Lothian; that he came to London with King James at his accession to the crown of England, and there spent his fortune, as many more did at that time, by which his son (Sir Isaac's father) was reduced to mean circumstances. To this Gregory bluntly replied, 'Newton a gentleman of East Lothian? I never heard of a gentleman of East Lothian of that name.' Upon this Sir Isaac said, 'that being very young when his father died, he had it only by tradition, and it might be a mistake,' and immediately turned the conversation to another subject.

"I confess I suspected that the gentleman who was my author had given some colouring to this story, and therefore I never mentioned it for a good many years.

"After I removed to Glasgow, I came to be very intimately acquainted with Mr. Cross, then Sheriff of Lanark, and one day at his own house mentioned this story, without naming my author, of whom I expressed some diffidence.

"The Sheriff immediately took it up as a matter worth being inquired into. He said he was well acquainted with Mr. Hepburn of Keith (who

¹ The nephew of the celebrated James Gregory, the Inventor of the Reflecting Telescope.

² This must have been after October 1725.—See pp. 310, 312.

was then alive), and that he would write him to know whether he ever heard Mr. Gregory say that he had such a conversation with Sir Isaac Newton. He said he knew that Mr. Keith, the ambassador, was also intimate with Mr. Gregory, and that he would write him to the same purpose.

“Some time after, Mr. Cross told me that he had answers from both the gentlemen above mentioned, and that both remembered to have heard Mr. Gregory mention the conversation between him and Sir Isaac Newton, to the purpose above narrated, and at the same time acknowledged that they had made no farther inquiry about the matter.

“Mr. Cross, however, continued the inquiry, and a short time before his death, told me that all he had learned was, that there is, or was lately, a baronet's family of the name of Newton in West Lothian or Mid-Lothian (I have forgot which): That there is a tradition in that family, that Sir Isaac Newton wrote a letter to the old knight that then was (I think Sir John Newton of Newton was his name), desiring to know what children, and particularly what sons he had, their age, and what professions they intended: That the old baronet never deigned to return an answer to this letter, which his family was sorry for, as they thought Sir Isaac might have intended to do something for them.”

Several years after this letter was written, a Mr. Barron, a relation of Sir Isaac Newton, seems to have been making inquiries respecting the family of his ancestor, and in consequence of this the late Professor Robison applied to Dr. Reid, to obtain from him a more particular account of the remarkable conversation between Sir Isaac and Mr. James Gregory, referred to in the preceding letter. In answer to this request, Dr. Reid wrote the following letter, for which I was indebted to the late Sir John Robison, Sec. R.S.E., who found it among his father's manuscripts.

LETTER FROM DR. REID TO PROFESSOR ROBISON RESPECTING THE FAMILY OF SIR ISAAC NEWTON.

“DEAR SIR,

“I am very glad to learn by yours of April 4, that a Mr. Barron, a near relation of Sir Isaac Newton, is anxious to inquire into the descent of that great man, as the family cannot trace it farther, with any certainty, than his grandfather. I therefore, as you desire, send you a precise account of all I know; and am glad to have this opportunity, before I die, of putting this information in hands that will make the proper use of it, if it shall be found of any use.

“Several years before I left Aberdeen (which I did in 1764), Mr. Douglas of Feckel, the father of Sylvester Douglas, now a barrister at London, told me, that, having been lately at Edinburgh, he was often in company with Mr. Hepburn of Keith, a gentleman of whom I had some acquaintance, by his lodging a night in my house, at New Machar, when he was in the rebel army in 1745. That Mr. Hepburn told him, that he had heard Mr. James Gregory, professor of mathematics, Edinburgh, say, that, being one day in familiar conversation with Sir Isaac Newton at London, Sir Isaac said, ‘Gregory, I believe you don't know that I am a Scotchman?’ ‘Pray, how is that?’ said Gregory. Sir Isaac said he was informed that

his grandfather (or great-grandfather) was a gentleman of East (or West) Lothian: that he went to London with King James I. at his accession to the crown of England: and that he attended the Court in expectation, as many others did, until he spent his fortune, by which means his family was reduced to low circumstances. At the time this was told me, Mr. Gregory was dead, otherwise I should have had his own testimony, for he was my mother's brother. I likewise thought at that time, that it had been certainly known that Sir Isaac had been descended from an old English family, as I think is said in his *Eloge* before the Academy of Sciences at Paris, and therefore I never mentioned what I had heard for many years, believing that there must be some mistake in it.

"Some years after I came to Glasgow, I mentioned (I believe for the first time) what I had heard to have been said by Mr. Hepburn, to Mr. Cross, late sheriff of this county, whom you will remember. Mr. Cross was moved by this account, and immediately said:—'I know Mr. Hepburn very well, and I know he was intimate with Mr. Gregory; I shall write him this same night, to know whether he heard Mr. Gregory say so or not.' After some reflection, he added, 'I know that Mr. Keith, the ambassador, was also an intimate acquaintance of Mr. Gregory, and as he is at present in Edinburgh, I shall likewise write to him this night.'

"The next time I waited on Mr. Cross, he told me that he had wrote both to Mr. Hepburn and Mr. Keith, and had an answer from both, and that both of them testified that they had several times heard Mr. James Gregory say, that Sir Isaac Newton told him what is above expressed, but that neither they nor Mr. Gregory, as far as they knew, ever made any farther inquiry into the matter. This appeared very strange both to Mr. Cross and me, and he said he would reproach them for their indifference, and would make inquiry as soon as he was able.

"He lived but a short time after this; and in the last conversation I had with him upon the subject, he said, that all he had yet learned was, that there was a Sir John Newton of Newton, in one of the counties of Lothian (but I have forgot which), some of whose children were yet alive; that they reported that their father, Sir John, had a letter from Sir Isaac Newton, desiring to know the state of his family, what children he had, particularly what sons, and in what way they were. The old knight never returned an answer to this letter, thinking probably that Sir Isaac was some upstart, who wanted to claim a relation to his worshipful house. This omission the children regretted, conceiving that Sir Isaac might have had a view of doing something for their benefit.

"After this I mentioned occasionally in conversation what I knew, hoping that these facts might lead to some more certain discovery, but I found more coldness about the matter than I thought it deserved. I wrote an account of it to Dr. Gregory, your colleague, that he might impart it to any member of the Antiquarian Society, who he judged might have the curiosity to trace the matter farther.

"In the year 1787, my colleague, Mr. Patrick Wilson, professor of astronomy, having been in London, told me on his return that he had met accidentally with a James Hutton, Esq. of Pimlico, Westminster, a near relation of Sir Isaac Newton, to whom he mentioned what he had heard from me with respect to Sir Isaac's descent, and that I wished much to know something more decisive on that subject. Mr. Hutton said, if I

pleased to write to him he would give me all the information he could give. I wrote him accordingly, and had a very polite answer, dated at Bath, 25th December 1787, which is now before me. He says, 'I shall be glad, when I return to London, if I can find in some old notes of my mother, any thing that may fix the certainty of Sir Isaac's descent. *If he spoke so to Mr. James Gregory, it is most certain he spoke truth.* But Sir Isaac's grandfather, not his great-grandfather, must be the person who came from Scotland with King James I. If I find any thing to the purpose, I will take care it shall reach you.'

"In consequence of this letter I expected another from Mr. Hutton when he should return to London, but have never had any. Mr. Wilson told me he was a very old man, and whether he be dead or alive I know not.

"This is all I know of the matter, and, for the facts above-mentioned, I pledge my veracity. I am much obliged to you, dear Sir, for the kind expressions of your affection and esteem, which, I assure you, are mutual on my part, and I sincerely sympathize with you on your afflicting state of health, which makes you consider yourself as out of the world, and despair of seeing me any more.

"I have been long out of the world by deafness and extreme old age. I hope, however, if we should not meet again in this world, that we shall meet and renew our acquaintance in another. In the meantime, I am, with great esteem, dear Sir, yours affectionately,

"THO. REID.

"GLASGOW COLLEGE, 12th April 1792."

This curious letter I published in the *Edinburgh Philosophical Journal* for October 1820. It excited the particular attention of the late George Chalmers, who sent me an elaborate letter upon the subject; but as I was at that time in the expectation of obtaining some important information through other channels, the letter was not published. This hope, however, has been disappointed. A careful search was made at my request through the charter-chest of the Newtons of Newton in East Lothian, by Mr. Richard Hay Newton, the representative of that family, but no document whatever has been found that can throw the least light upon the matter. It deserves to be remarked, however, that Sir Richard Newton, the alleged correspondent of Sir Isaac, appears to have destroyed his correspondence; for though the charter-chest contains the letters of his predecessors for some generations, yet there is not a single epistolary document either of his own or of his lady's.

Hitherto the evidence of Sir Isaac's Scottish descent has been derived chiefly from his conversation with Mr. James Gregory; but I am enabled to corroborate this evidence by the following information, derived, as will be seen, from the family of the Newtons of Newton. Among various memoranda in the handwriting of Professor Robison, who proposed to write the life of Sir Isaac, are the following:—

"Ist, Lord Henderland informed me in a letter, dated March 1794, that he had heard from his infancy that Sir Isaac considered himself as descended from the family of Newton of Newton. This he heard from his uncle Richard Newton of Newton (who was third son of Lord William Hay of Newhall.) "He said that Sir Isaac wrote to Scotland to learn

whether any descendants of that family remained, and this (it was thought) with the view to leave some of his fortune to the family possessing the estate with the title of baronet. Mr. Newton not having this honour, and being a shy man, did not encourage the correspondence, because he did not consider *himself* as of kin to Sir Isaac," &c.

"2d, Information communicated to me by Hay Newton, Esq. of that Ilk, 18th August 1800."

"The late Sir Richard Newton of Newton, Bart., chief of that name, having no male children, settled the estate and barony of Newton in East Lothian county upon his relation, Richard Hay Newton, Esq., son of Lord William Hay."¹—"It cannot be discovered how long the family of Newton have been in possession of the barony, there being no tradition concerning that circumstance further than that they came originally from England at a very distant period, and settled on these lands."—"The celebrated Sir Isaac Newton was a distant relation of the family, and corresponded with the last baronet, the above-mentioned Sir Richard Newton."

In writing to James Watt on the 3d May 1797, Professor Robison says,—"I believe I told you that I had been on the hunt to find documents of Sir Isaac Newton's Scotch extraction, and that he himself firmly believed that his grandfather was a younger son of Sir — Newton of that Ilk, in East Lothian, and wrote to the last man of the family requesting information whether some of the younger sons did not attend James VI. when he succeeded to the Crown of England? I am still in hopes of finding that letter."²

The preceding documents furnish the most complete evidence that the conversation respecting Sir Isaac Newton's family took place between him and Mr. Gregory; and the testimony of Lord Henderland proves that his own uncle, Richard Newton of Newton, the immediate successor of Sir Richard Newton, with whom Sir Isaac corresponded, was perfectly confident that such a correspondence took place.

All these circumstances prove that Sir Isaac Newton could not trace his pedigree with any certainty beyond his grandfather, and that there were two different traditions in his family, one which referred his descent to John Newton of Westby, and the other to a gentleman of East Lothian who accompanied King James VI. to England. In the first of these traditions he seems to have placed most confidence in 1705, when he drew out his traditionary pedigree; but as the conversation with Professor James Gregory respecting his Scotch extraction took place *twenty years* afterwards, namely, between 1725 and 1727, it is probable that he had discovered the incorrectness of his first opinions, or at least was disposed to attach more importance to the other tradition respecting his descent from a Scotch family.

In the letter addressed to me by George Chalmers, I find the following observations respecting the immediate relations of Sir Isaac:—"The Newtons of Woolsthorpe," says he, "who were merely yeomen farmers, were not by any means opulent. The son of Sir Isaac's father's brother was a carpenter called John. He was afterwards appointed gamekeeper to Sir

¹ This entail was executed in 1724, a year or two before Sir Richard's death.

² *Origin and Progress of the Mechanical Inventions of JAMES WATT.* By James Patrick Muirhead, Esq., A.M. Vol. ii p. 252. Lond. 1854.

Isaac, as lord of the manor, and died at the age of sixty in 1725. This John had a son John, who was Sir Isaac's second cousin, and who became possessed of the whole land estates at and near Woolsthorpe, which belonged to the great Newton, as his heir-at-law. John became a worthless and dissolute person, who very soon wasted this ancient patrimony, and, falling down with a tobacco-pipe in his mouth when he was drunk, it broke in his throat, and put an end to his life at the age of thirty years, in 1737."¹

The following account of Sir Isaac's heir-at-law is given by the Rev. Mr. Mason, Rector of Colsterworth, in a letter to Mr. Conduitt, dated March 23, 1727, three days after Newton's death:—"This morning I received from you the melancholy news of that truly great and good gentleman's death, Sir Is. N. I have, according to your desire, made Sir Isaac's heir and representative, who is the bearer of this, acquainted with it, but, God knows, a poor representative of so great a man; but this is a case that often happens. There are two families of the Newtons in this parish, both descended from the second and third brothers of Sir Isaac's father. The second brother was Robert Newton, from whom the bearer of this, John Newton, is descended. The third was Richard, from whom descends Robert Newton, now living in this parish, so that, without dispute, John Newton, the bearer, is heir to the estate not devised by will."

No. XXXII.

(Referred to in page 335.)

LETTER FROM SIR ISAAC NEWTON TO A FRIEND.

"S^r,

"Before I received yo^rs I had an account from Mr. Parish of y^e arbitration, and thereupon wrote to Mr. Parkins to know how y^e indentures run, and to Mr. Storer, to know distinctly what it is that his son Oliver deposes. I had a speedy answer from Mr. Parkins, whereby I understand that Mr. Storer is bound to leave all things in a tenantable repair, by a clause which you do not mention; but from Mr. Storer I have not yet received an answer, and therefore cannot write to you what I designed for putting an end to these differences.

"When I met Mr. Storer and his sons at Wolstrobe, y^t is at Lady-day last, I was satisfied with the removal of y^e wheat hoval and with y^e thatch of y^e houses in view, as I went up y^e yard to y^e house. I do not say y^t there was no faults, for I am short-sighted, and did not (y^t I remember) go close to y^e barn, not being then minded to call Mr. Storer to a strickt account for repairs. Thence we went into y^e orchard, and I was pleased with y^e repairs of y^e slated house, but told Mr. Storer's sons y^t he was an

¹ See this volume, page 335, note 2.

ill husband with y^e drain below, and he promised it should be scoured. Then turning to Robin's house I pointed to two very faulty places in the thatch, and Mr. Storer's son confessed it rained in, and promised it should be mended. Thence I went into y^e dwelling-house to receive Mr. Storer's rent, and when he was going to pay it he told me y^t his son found boards for y^e gutters of y^e Lucombe windows wh^h I was to pay for, but y^e bill was lost, and so desired y^t I would allow 30^s for these boards. After some words, I put it to him whether he could honestly affirm y^t y^e boards were worth so much. He answered he could not, but he hoped I would not stand with him for a small matter. To wh^h I presently answered y^t I would not stand with him, and so remitted 30^s of his rent on account of y^e bill wh^h he said was lost. About a fortnight after coming to Colsterworth, I was three or four times at Wolstroppe, and one of those times going into y^e garden I found y^e walls ruinous, and in going through y^e pales between y^e garden and y^e house, I observed y^t they and y^e great gates were much out of order. At y^t time also y^e pales were wanting to y^e swine-coat and some of y^e long pales pluck^t off from y^e cow-house. At y^t time I heard also y^t they had carried away y^e fence from y^e new quick in y^e clay-field, and made money of it. Mr. Storer represents y^t y^e hedge was decayed and grown useless before; but this is to excuse one fault with another, for Mr. Storer was to keep it in repair, I paying for y^e wood. After I understood these things, I was called out of y^e country before I could speak with Mr. Storer, and afterwards, in hay time, I had notice y^t y^e Linghouse was ruinous, for want of repair, and that Mr. Storer's son refused to repair it. Soon after a friend viewed the tenements, and sent me an acc^t of those things out of repair wh^h I had observed, and some other things also wh^h I had not noted. And at that time, or some time after, I understood that Mr. Storer's son refused absolutely to do any repairs, and had treated Will. Cottam with ill language about it. Whereupon, considering that they had not repaired Robin's house, and left divers other things out of repair, and that Mr. Storer's son, living w^t his father, and being his father's agent, c^d not persist in a refusal of repairs, with^t his father's knowledge and encouragement, I resolved to call the father to a general acc^t for repairs, wh^h c^d not be done but by suit, and because the son was concerned in the aforesaid hedge, I resolved to sue them both, and this the rather because his son had disparaged the living at Lady-day in my hearing, I being of opinion that he did it as well behind my back as before my face, to hinder me of tenants who might put me upon calling them to account for repairs. This was the occasion of the suit which I tell you, that you may understand I was not rash in beginning it, as Mr. Storer endeavours to persuade his friends.

"I hear 'tis represented I sh^d be well pleased w^t repairs at Lady-day, and allow Mr. Storer 30^s on that acc^t, and say that things were better in repair than when Mr. Burch left them. But I have told you that the 30^s was in discharge of a bill, and respected only the slating of the house, wh^h was done at my charges, and if I was pleased with what I had repaired, what is that to Mr. Storer? Because I eased [him] of repairs of the side of the house, there is the more reason that he sh^d leave other things in good repair. He was indeed at the charge of carriages, but that was a bargain, and I have, on the other hand, allowed him 30^s for boards, wh^h perhaps were not worth half the money. And if I was kind to him in that,

he is very disingenuous to turn it to my disadvantage. For this is to snap me by the fingers for giving him bread.

“ Whether I said that things were left better in repair by Mr. Storer than by Mr. Burch I do not remember, and if it be understood generally, it's manifestly false. For I c^d not say so of Robin's house, because I complained of its being out of repair, nor of the garden walls, because I had not then viewed them, nor of the gates and pales, because I did not see any repairs of late done to them, nor c^d I say so of the repairs of anything for wh^h I now sue. But of the slated house, and, if you please, of all the houses taken one with another, I might, and do now say, that they were better in repair when Mr. Storer left than when he entered. But then I add, that this is nothing to Mr. Storer's purpose, for 'tis my charge of 11^{lb} 10^s in slating, which makes amends for all the rest. And if I have repaired the main building substantially, that must not excuse Mr. Storer from repairing what belongs to his own share. So you see that what Mr. Storer alleges himself amounts to nothing. In short, as I did not begin this suit without just occasion, so now I have begun it I do not intend to end it without satisfaction. If Mr. Storer will send me a satisfactory answer to my last, I'll endeavour to make a final end in my next, but if he goes on to misrepresent things, I'll solicit Mr. Parish to give you another meeting. I thank you for undertaking the office of an arbitrator, and that you may inherit the blessing promised to peace-makers, is the hearty wish of—

NAPIER, BARON, i. 337.

Neptune, History of its Discovery, i. 320.
 Newton, Dr. Humphrey, ii. 45, 50.
 Newton, Sir Isaac, his birth, i. 3; his edu-
 cation, 6; his inventions and experi-
 ments, 7; enters Trinity College, Cam-
 bridge, 17; his early Discoveries, 20-26;
 his expenses at College, 15, 28; elected
 Fellow of Trinity, 27; made Lucasian
 Professor, 33; discovers the different re-
 frangibility of light, 38, 66; his reflecting
 telescope, 41; elected Fellow of the
 Royal Society, 63; involved in disputes
 by his optical discoveries, 69; his scheme
 for improving the Royal Society, 90;
 his mistake in supposing that bodies have
 the same dispersive powers, 98; on the
 moon's libration, 112; his letter on
 planting, 113; he opposes the doctrine of
 undulations, 119; his correspondence
 with Hooke, 124; his hypotheses on
 light, 134, 296; on the colours of thin
 and thick plates, 145, 151; on the
 colours of natural bodies, 154; on the
 inflexion of light, 175; on absolute re-
 fractive powers, 185; on double refraction
 and polarization, 188; his experi-
 ments on the eye, 191, 358; on binocular
 vision, 193; on the semi-decussation of
 the optic nerves, 199, and App. 390; on
 the influence of strong light upon the
 retina, 208, his reflecting sextant, 209;
 and microscope, 211; his prisms for
 Newtonian telescopes, 214; his astron-
 omical discoveries, 219, 251; is induced
 by Halley to publish them, 266; the
 Principia published, 271; new edition
 by Cotes, 274; analysis of its contents,
 279; his philosophy long stationary,
 300; his letter to Aston, 365; his letter
 to Boyle, 381; ditto to Briggs, 390; his

correspondence with Halley, 399; Leib-
 nitz's Scholium, draughts of it, 427; his
 correspondence with Wallis, 428; his
 discovery of fluxions, 442; his mathema-
 tical writings, 445; communicates his dis-
 coveries in series to Leibnitz, 447; account
 of the controversy regarding fluxions,
 453-463; ii. 1-11; the *Commercium*
Epistolicum, 14; renewal of the con-
 troversy, 15-43; his rooms in Trinity Col-
 lege, 46; letters from Mr. Wickins and
 Dr. Newton on his College life, 47; on
 the theory of the earth, 57; is one of the
 deputies to resist the Royal Mandamus,
 62; represents the University in Parlia-
 ment, 69; his letters to Dr. Covel on the
 accession of King William, 70; his
 acquaintance with Locke and Huygens,
 71; attempts to get him some appoint-
 ment, 72; their failure, 74; death of his
 mother, 74; corresponds with Locke on
 alchemy, 76; his four letters to Bentley,
 79; his ill health, 85; misrepresented by
 Biot, 88; his letter to Pepys, 99, App.
 372; and Locke, 100; his study of the
 lunar irregularities, 108; his correspond-
 ence and difference with Flamsteed, 108,
 132; Charles Montague appoints him
 Warden, and afterwards Master of the
 Mint, 138, 140; the case of Chaloner
 and the Coiners discussed, 144; his
 second difference with Flamsteed, 148;
 is elected one of the eight Foreign Ass-
 sociates of the Academy of Sciences, 153;
 again represents the University in Par-
 liament, 154; is knighted at Cambridge
 by Queen Anne, 155; his love-letter to
 Lady Norris, 156; fails in being restored
 to Parliament in 1707, 162; his third
 difference with Flamsteed, 163; defence
 of him against the charges of Mr. Baily,
 171; Bentley's letter to him on the com-
 pletion of the second edition of the Prin-
 cipia, 188; his residence in London, 192;
 evidence on the Longitude Bill, 198;
 his niece, Mrs. Catherine Barton, de-
 fended, 208-218; replies to Leibnitz's
 attack on his philosophy, 219; corre-
 sponds with Varignon and J. Bernoulli,
 226, App. 388-401; and with Fontenelle
 and Derham, 235, App. 402, 403; his
 chronology, 236; his theological writ-
 ings, published and unpublished, 247-
 287; on Daniel and the Apocalypse, 259;
 on the corruption of two texts, 263; his
 opinion on the subject of the Trinity,
 270, App. 411; his theological MSS.,
 272; his chemical and alchemical stud-
 ies, 288; on the scale of heat, 290; his

- ill-health and recovery, 303; Pemberton edits the third edition of the *Principia*, 304; is attacked with stone, 309; his testimonial to Maclaurin, 312; is visited by the Abbé Alari and Crell, 313, 314; attends the Royal Society, March 2d, 316; his death on the 20th, 317; his body lies in state, 317; his funeral and burial in Westminster Abbey, 318; monument to his memory, 318; statues, pictures, and other relics of him, 319; monument at Grantham, 320; his property and successors, 321; his philosophical, social, and moral character, 323; memorials of him, 337; letters to him from Dr. Wilson, 353; his letter to Thomas Burnet, 357; on the effect of heat on magnets, 362; his letter to Dr. Covel, 365; letter to him from Dr. Bentley, 367; ditto from S. Pepys, 372; his correspondence with Dr. Mill, 373; letter to him from Flamsteed, 376; his letter to Flamsteed, 384; Varignon's letter to him, 388; his answer, 389; letters to him from John Bernoulli, 392-396; letter to him from Brook Taylor, 397; ditto from James Stirling, 401; ditto from Fontenelle, 402; ditto from Dr. Derham, 403; his *Irenicum* or Ecclesiastical Polity tending to Peace, 407; his queries regarding ὁμοούσιος, 411; his method of making speculum metal, 413; observations on the Scotch origin of his family, 419; his letter to a friend, 425.

MORE WORLDS THAN ONE

THE CREED OF THE PHILOSOPHER AND THE HOPE OF THE CHRISTIAN.

By SIR DAVID BREWSTER, K.H.; D.C.L., F.R.S., ETC.

“The anti-pluralist generally attempts to carry out his views by ‘running down’ the rest of the Creator’s productions. . . . This is not the sort of Christian philosophy which we should like to see embodied in Bridgewater Treatises, and fortunately a fitting antidote has been supplied. The able work of Sir David Brewster has only come to our hand during the passage of these sheets through the press; but it must be enough to say, that in this volume one of the Masters of Science has entered as emphatic a protest against the Essayist’s views, as it would be possible to pronounce.”—*British Quarterly Review*.

“We have had much pleasure in the consideration of this work. We earnestly recommend it to our readers. It treats of subjects of boundless importance, and it discusses them ably and concisely. The concluding Chapter, entitled ‘The Future of the Universe,’ is one of the most eloquent and pious specimens of writing we have ever seen. It gives additional weight to the preceding arguments, calms and elevates the mind, and proves that science is indeed the handmaid of religion.”—*Britannia*.

BY THE SAME AUTHOR,

FOURTH EDITION, Cloth, 4s. 6d.,

THE MARTYRS OF SCIENCE;

OR,

THE LIVES OF GALILEO, TYCHO BRAHE, AND KEPLER.

Miss Brewster is precisely one of the ladies for the time,—not a drowsy dreamer, but fully awake, strong in heart, ardent in zeal, and intent on the vigorous use of right means to promote right ends.—*British Banner.*

* * * *A few Copies are still on hand of the FIRST SERIES (Original Edition).* Crown 8vo, cloth, price 2s.

Letters from Cannes and Nice.

With Ten Illustrations by a Lady. Handsome 8vo, cloth extra, price 12s.

The descriptions of the people, the neighbourhood, and the occurrences of the journey, are agreeable, from the well-bred kindness of the writer, that beams through her pages, and made many friends *en route* and during her sojourn.—*Spectator.*

Leaves of Healing for the Sick and Sorrowful.

Foolscap 4to, price 3s. 6d.

The Motherless Boy.

Small 8vo, Cloth Limp, price 1s.

Sunbeams in the Cottage.

Thirty-Fourth Thousand. Limp cloth, price 1s.

The fruit alike of strong sense and philanthropic genius. . . . There is in every chapter much to instruct the mind as well as to mould the heart and to mend the manners. The volume has all the charms of romance, while every page is stamped with utility.—*Christian Witness.*

Little Millie and her Four Places.

Thirty-Ninth Thousand. Limp cloth, price 1s.

The narrative is simple and attractive; the plan of the work is well conceived; the style is fluent and lively; and the interest of the tale is well sustained to the close.—*Spectator.*

Also, Crown 8vo, cloth, price 3s. 6d.

The Word and the World.

Tenth Edition. Sewed, price 2s. per dozen.
